Subject: score over length search 10/016,149

Hi Paul,

I need a score over length nucleotide sequence search against nucleobases 703 to 992 of SEQ ID NO:3 in the above entitled case. I need the lower and upper limits to be 8 and 50, respectively, I need any hits that are above 65% complementarity, and please transfer as many hits into the excel program as possible. If possible, please search the interference databases as well.

Thanks,
Doug Schultz

OM nucleic - nucleic search, using sw model

Run on: July 12, 2004, 10:22:28 ; Search time 3 Seconds
(without alignments)
4.029 Million cell updates/sec

Title: us-10-016-149-3
Perfect score: 290
Sequence: 1 tccaggaggtcccaggagag.....taaattcgtgtatgggtat 290

Scoring table: IDENTITY NUC
Gapop 10.0 , Gapext 0.5

Searched: 1203 seqs, 20842 residues

Total number of hits satisfying chosen parameters: 2406

Minimum DB seq length: 8
Maximum DB seq length: 50

Post-processing: Minimum Match 0%
Maximum Match 100%
Listing first 1225 summaries

Database : rgedb.*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

TITLE Direct Submission

JOURNAL Submitted (23-OCT-2003) Balzerque S., UMRGV, INRA/CNRS, 2 rue Gaston Cremieux, 91057 Evry cedex, FRANCE

COMMENT PCR was performed on DNA from transformants of Arabidopsis thaliana plants from INRA (Versailles). The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at <http://dbsgap.versailles.inra.fr/publiclines/>. This sequence has been generated in the framework of the French plant genomics program 'Genoplante' (<http://www.genoplante.com> and <http://genoplante-info.infobiogen.fr>).

Submitted (21-NOV-2002) Balzergue S., UMRGV, INRA/CNRS, 2 rue

Gaston Cremieux, 91057 Evry cedex, FRANCE
 PCR was performed on DNA from transformants of Arabidopsis thaliana
 plants from INRA (Versailles). The DNA fragment(s) resulting from
 the PCR were directly sequenced from the left or the right border
 to determine the genomic sequence flanking the insertion. T-DNA
 derived sequences were removed. Information to order the
 corresponding mutant line and a link to a database providing a
 graphical display of the insertion site are available at
<http://dbsgap.versailles.inra.fr/publiclines/>. This sequence has
 been generated in the framework of the French plant genomics
 program 'Genoplante' (<http://www.genoplante.com> and
<http://genoplante-info.infobiogen.fr>).

 PT Arraying genome clones.
 XX
 PS Claim 4; Page 11; 528pp; Japanese.
 XX
 CC The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each well of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention

PT New antisense oligonucleotides for modulating phospholipase A2 group V
PT gene expression, particularly useful for treating an autoimmune disorder
PT or an inflammatory disorder.
XX
PS Claim 3; Page 75; 99pp; English.
XX
CC The invention relates to antisense compounds, compositions and methods
CC for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is
CC also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and
CC HPLA2-10. The antisense oligonucleotide is useful for treating an animal
CC having a disease or conditions associated with PLA2 group V, e.g. an
CC autoimmune disorder or an inflammatory disorder. It is also useful for
CC modulating PLA2 group V. The antisense compounds are also useful for
CC diagnostics, therapeutics, prophylaxis, or as research reagents or kits.
CC The present sequence is an antisense oligonucleotide targetted to human
CC PLA2 DNA. This sequence is used to illustrate the method of the invention

XX gene expression, particularly useful for treating an autoimmune disorder

PT or an inflammatory disorder.

XX Example 15; Page 75; 99pp; English.

CC The invention relates to antisense compounds, compositions and methods
 CC for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is
 CC also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and
 CC HPLA2-10. The antisense oligonucleotide is useful for treating an animal
 CC having a disease or conditions associated with PLA2 group V, e.g. an
 CC autoimmune disorder or an inflammatory disorder. It is also useful for
 CC modulating PLA2 group V. The antisense compounds are also useful for
 CC diagnostics, therapeutics, prophylaxis, or as research reagents or kits.
 CC The present sequence is an antisense oligonucleotide targetted to human
 CC PLA2 DNA. This sequence is used to illustrate the method of the invention

XX
XX Claim 3; Page 75; 99pp; English.
XX
XX The invention relates to antisense compounds, compositions and methods
XX for modulating phospholipase A2 (PLA2) group V gene expression. PLA2 is
XX also known as calcium dependent phospholipase A2, PLA2G5, hVPLA2 and
XX hPLA2-10. The antisense oligonucleotide is useful for treating an animal
XX having a disease or conditions associated with PLA2 group V, e.g. an
XX autoimmune disorder or an inflammatory disorder. It is also useful for
XX modulating PLA2 group V. The antisense compounds are also useful for
XX diagnostics, therapeutics, prophylaxis, or as research reagents or kits.
XX The present sequence is an antisense oligonucleotide targeted to human
XX PLA2 DNA. This sequence is used to illustrate the method of the invention

 PS Claim 1; SEQ ID NO 83917; 9pp; English.
 XX
 CC The invention discloses a microarray comprising a plurality of nucleic
 CC acid probes including one of 2,018,500 fully defined sequences, or its
 CC perfect match, perfect mismatch, antisense match or antisense mismatch.
 CC Also disclosed is a method of gene expression analysis. The array is used
 CC in monitoring gene expression levels by hybridisation to a DNA library,
 CC in analysis of genetic variation or in hybridisation of tag-labelled
 CC compounds. The nucleic acid probes are specifically designed for analysis
 CC of at least one target sequence. The method of analysis comprises
 CC hybridising at least one or more nucleic acids to at least two or more
 CC nucleic acid probes and detecting the hybridisation. The nucleic acid
 CC probes are attached to a solid support. The analysis comprises monitoring
 CC gene expression levels, identifying biallelic markers or polymorphisms,
 CC or family members of a gene and a cross-species comparison. Each of the
 CC nucleic acids further comprises a tag sequence. The array of nucleic acid
 CC probes is useful in situ hybridisation, in Southern, Northern or dot-
 CC blot hybridisation to identify or detect the sequence or specific
 CC mutations of any gene, in mapping the 5' termini of mRNA molecules by
 CC for additional subclones containing segments of DNA that have been
 CC isolated and previously sequenced. The sequence presented is one of the
 CC nucleic acid probes incorporated in the microarray. Note: The sequence
 CC data for this patent can also be obtained in electronic format directly

 XX DR
 XX
 XX New Dirofilaria and Brugia ankyrin proteins and nucleic acid encoding
 PT them, useful for treating and protecting animals from diseases caused by
 PT parasitic helminths, e.g. heartworm disease, elephantiasis or hydrocele.
 XX
 XX Example 10; Col 46; 120pp; English.
 XX
 XX The invention relates to ankyrin proteins and nucleic acids from the
 CC parasitic helminths Dirofilaria immitis and Brugia malayi. It also
 CC relates to antibodies raised against such ankyrin proteins and to
 CC compounds that inhibit Dirofilaria or Brugia ankyrin function.
 CC Dirofilaria ankyrin cDNAs were isolated from a D. immitis 48 hour L3 cDNA
 CC library using PCR primers based on the sequence of the E1 ankyrin from
 CC Onchocerca volvulus and the Caenorhabditis elegans ankyrin UNC-44 genes.
 CC Brugia ankyrin cDNAs were isolated from a B. malayi adult female cDNA
 CC library using D. immitis ankyrin and C. elegans UNC-44 PCR primers.
 CC Dirofilaria or Brugia ankyrin proteins and nucleic acids represent novel
 CC targets for anti-helminthic vaccines and drugs. Ankyrin nucleic acid
 CC molecules, proteins, vaccines and compositions are useful for protecting
 CC animals, particularly dogs, from diseases caused by parasitic helminths
 CC (e.g., heartworm disease, elephantiasis or hydrocele), as well as for
 CC treating the infection. The ankyrin nucleic acid molecules, proteins,
 CC vaccines and compositions of the invention are especially useful in
 CC treating and preventing infections caused by filariid nematodes (e.g., D.
 CC immitis and B. malayi), and ascarid, capillariid, strongyloid,
 CC strongyloides, trichostrongyle, or trichurid nematodes and are also
 CC useful against cestodes and trematodes. The therapeutic compositions may
 CC be administered to mammals, including dogs, cats, humans, ferrets,
 CC horses, cattle, sheep, and other pets; economic food animals; or zoo
 CC animals. The ankyrin nucleic acid molecules, proteins and compounds may
 CC also be used as diagnostic reagents to detect infection by parasitic
 CC helminths. Prior art anti-helminthic drugs require repeated
 CC administration, which often leads to the development of resistant
 CC helminth strains that no longer respond to treatment. Such drugs can also
 CC cause harmful side effects in the individual being treated, and a number
 CC of these drugs can only treat the symptoms of a parasitic disease, being
 CC unable to prevent infection by the parasitic helminth. Elucidation of D.
 CC immitis and B. malayi ankyrin protein and DNA sequences facilitates the
 CC development of agents which inhibit ankyrin-mediated parasite
 CC developmental and migratory pathways. Sequences AAA58201-A58219 and
 CC AAA58278-A58291 represent PCR primers used in the exemplifications of the
 CC invention to isolate D. immitis and B. malaya ankyrin cDNAs

 CC The present invention describes a chimeric bifunctional molecule (I)
 CC comprising at least a first functional molecule covalently linked to a
 CC second functional molecule, which is able to modulate the activity of the
 CC permeability transition pore complex (PTPC) of the mitochondria. (I) has
 CC the function of specifically targeting and entering a tissue cell
 CC population. The second functional molecule has the function of
 CC specifically targeting, and inducing or preventing the death of the cells
 CC by apoptosis by regulating the opening or the closing of the PTPC of the
 CC mitochondria or its fragment. (I) has virucide, neuroprotective,
 CC vasotropic and cytostatic activities, and can be used as a mitochondrial
 CC permeability transition pore complex (PTPC) modulator. (I) is useful for
 CC treating or preventing a pathological infection or disease. (I) is also
 CC useful for regulating cell death regulatory molecules, specifically the
 CC apoptogenic function of the PTPC, for treating e.g. cancer, ischaemia,
 CC neurodegenerative diseases, fulminant hepatitis or viral infections. The
 CC present sequence represents a primer which is used in an example from the
 CC present invention

 PT polymorphic bovine acyl CoA:diacylglycerol transferase gene useful for
 PT testing a mammal for its predisposition for fat content of milk and for
 PT meat marbling.
 XX
 PS Example 1; Page 36; 91pp; English.
 XX
 CC The present invention describes a nucleic acid molecule (NA) (I) encoding
 CC a bovine acyl CoA:diacylglycerol transferase (DGAT) contributing to or
 CC indicative for low fat content of milk and to low meat marbling

CC (intramuscular fat content). Human DGAT is located to chromosome 8, and
CC bovine DGAT is located to chromosome 14. (I) is useful for testing a
CC mammal for its predisposition for fat content of milk and/or its
CC predisposition for meat marbling. The method comprises analysing the gene
CC encoding DGAT for nucleotide polymorphisms (e.g. single nucleotide
CC polymorphisms (SNPs)) which are connected with the predisposition. The
CC nucleotide polymorphisms are located in the coding region of the DGAT
CC gene and result in substitution, deletion and/or addition of an amino
CC acid sequence of the polypeptide which is encoded by the gene. The
CC nucleic acid molecule has at the position 10433 and 10434 of the DGAT
CC gene a guanine and a cytosine residue, at position 3343 a cytosine or
CC guanine, 11030 a guanine, 11048 a cytosine or thymine and 11093 a
CC thymine, which correlate with a predisposition for low fat content of
CC milk and low meat marbling. The nucleic acid molecule has at the position
CC corresponding to position 10433 and 10434 of the DGAT gene two adenine
CC residues which correlate with a predisposition for high content of milk
CC and high meat marbling. The nucleotide polymorphisms are located in a
CC region which is responsible for the regulation of the expression of the
CC product of the gene encoding DGAT. ABZ76924 to ABZ77045 and ABP96035 to

XX
XX New composition containing an aerosolized antisense ET-1 molecule -
PT useful for treating pulmonary hypertension.
XX
XX Claim 13; Page 22; 37pp; English.
XX
XX The invention relates to a method for treating pulmonary hypertension by
CC delivering a therapeutic composition, comprising an aerosolised antisense
CC endothelin-1 (ET-1) molecule, to the lungs of a patient. The composition

CC can be used in a method for determining the efficacy of the treatment for
 CC e.g. when studying molecules and observing the effects of the composition
 CC on an animal model system hypersensitive to antiseptic ET-1. The method is
 CC useful for treating pulmonary hypertension. The aerosolised antiseptic ET-
 CC 1 molecule permits inhibition of the ET-1 transcription, which relieves
 CC pulmonary hypertension. Its use avoids side effects caused by alternative
 CC therapies. Sequences AAX32375-386 represent specifically claimed
 CC antiseptic ET-1 sequences of rat origin

FT Determining the methylation status of a target nucleic acid sequence, for
 FT identifying candidate disease genes, comprises utilizing probe sets
 FT complementary to first and second binding domains of the methylation site
 FT in the sequence.

XX Example 3; Page 46; 60pp; English.

XX The invention relates to methods for detecting the presence or absence of
 CC methylation in a target nucleic acid sequence using probe sets
 CC complementary to first and second binding domains located upstream and
 CC downstream of one or more methylation sites of interest in a nucleic acid
 CC sequence. Methylation determination can be combined with the detection of
 CC polymorphisms, including single nucleotide polymorphisms and/or gene
 CC dosage determinations, to provide a more complete genetic profile at a

CC locus of interest, and can be used in genotyping and identifying
 CC candidate disease genes. The present polyfluoresceinated reporter probe,
 CC denoted REP1, was used in a methylation assay of the tumour suppressor
 CC p53 gene for use in lung cancer screening. The probe corresponds to
 CC nucleotides 1796-1774 of the gene. A 1080 bp sequence from exon 5 through
 CC intron 7 of the p53 gene was used as target. This contains 4 HpaII
 CC sensitive CpG methylation sites known to be associated with malignant
 CC transformation-specific hypomethylation

PT carbohydrate oxidase(s) for protection against Phytophthora and Pythium
PT sp.
XX
XX Example 13; Page 40; 139pp; English.
XX This primer was designed at the start of the mature protein for the opium
CC poppy berberine bridge enzyme (PBBE) gene. It was used with a primer
CC (see AAV27300) from the stop codon region of the PBBE gene to isolate
CC the mature portion of the PBBE gene. A BLAST homology search revealed
CC high homology between PBBE and the amino acid sequence of MS59
CC antifungal protein (see AAW55053) of sunflower. Claimed antifungal
CC proteins, including MS59 and its homologues, have a mol. wt. of 55-65 kDa
CC (SDS-PAGE); have carbohydrate oxidase activity, show anti-Phytophthora
CC and/or anti-Pythium activity, can be expressed in transgenic plants to
CC reduce susceptibility to infection by fungi, or expressed in host cells
CC for use in antifungal compositions. Plants engineered to express the
CC antifungal proteins require reduced treatments with fungicides and have a
CC longer shelf-life

XX Constructing strains for identifying gene products as effective targets
PT for therapeutic intervention, by inactivating in the strain one allele of
PT a gene and placing other allele of the gene under conditional expression.
XX
PS Claim 36; SEQ ID NO 4849; 167pp + Sequence Listing; English.
XX
CC The invention relates to constructing (M1) a strain of diploid fungal
CC cells in which both alleles of a gene are modified, comprising modifying
CC one allele by insertion or replacement by a cassette having an
CC expressible selectable marker and modifying other allele by
CC recombination, of a promoter replacement fragment with a heterologous
CC promoter, so that expression of the second allele is regulated by the
CC promoter. (M1) is useful for constructing a strain of diploid fungal
CC cells in which both alleles of a gene are modified. The diploid fungal
CC cells having both alleles modified are useful for identifying a gene that
CC is essential to the survival or growth of a fungus, a gene that
CC contributes to the virulence and/or pathogenicity of a fungus, a gene
CC that contributes to the resistance of a diploid fungus to an antifungal
CC agent, an antifungal agent that inhibits the growth of a diploid fungus
CC and for identifying a therapeutic agent for treatment of a mammalian
CC disease. (M1) is useful for identifying a compound which modulates the
CC activity of a gene product, preferably enzymatic activity, carbon
CC compound catabolism, biosynthetic, transporter, transcriptional,
CC translational, signal transduction, DNA replication and cell division
CC activity. The method is useful for identifying a compound having the
CC ability to inhibit growth or proliferation of C. albicans cells and for
CC treating infection by C. albicans. The present sequence is that of a PCR
CC primer used in the method of the invention. Note: The sequence data for
CC this patent is not represented in the printed specification but is based
CC on sequence information supplied to Derwent by the European Patent Office

XX
XX New genotyping oligonucleotide, useful for detecting the presence,
PT absence or identity of single polynucleotide polymorphism in a nucleic
PT acid sample.
XX
XX Claim 1; Page 66; 83pp; English.
XX
CC Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC primer extension (SNPE) primers, and the sequences of regions flanking
CC sites of single nucleotide polymorphisms SNPs. The present invention
CC includes kits for determining the presence or absence of a SNP, using the
CC oligonucleotides of the invention. The PCR primers are used to amplify a
CC SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC The oligonucleotides are useful for genotyping a nucleic acid sample by
CC performing a single-nucleotide primer extension reaction. The
CC oligonucleotides are useful for determining the presence, absence or
CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC assess by association analysis the genotype of an individual or group of
CC individuals, having a pathological phenotypic trait suspected of being
CC caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC traits also include symptoms of or susceptibility to multifactorial
CC disease of which a component is or may be genetic such as autoimmune
CC diseases, including, rheumatoid arthritis, multiple sclerosis,
CC inflammation, cancer, nervous system diseases and infection by pathogenic
CC microorganism. The method is also useful in forensic investigations and
CC paternity analysis. The present sequence represents a PCR primer specific
CC for a human SNP containing DNA sequence

DR Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL
PT -1, useful for treating disorders associated with decreased expression or
PT activity of human POSHL1.
XX
PS Example 2; SEQ ID NO 1116; 60pp + Sequence Listing; English.
XX
CC The invention relates to an isolated SH3 domain (POSH)-like signalling
CC protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino
CC acids (S1, ABB83999), a sequence having 65% sequence identity to (S1),
CC (S1) having 95% deviations, especially conservative substitutions or a
CC fragment of the sequences comprising at least 8 contiguous amino acids.
CC Human POSHL 1 is a proto-oncogene/oncogene product that functions as an
CC adaptor protein that interacts with Rho family small GTPases as well as
CC downstream components of the signal transduction pathway. (I) is useful
CC for identifying a specific binding partner. (I) and nucleic acids (II)
CC encoding (I) are useful for diagnosing, monitoring disease and treating
CC caused by altered expression of human POSHL1 including diagnosing and
CC treating cancer, they useful in the development of vaccines and (II) is
CC useful in gene therapy. (II) is useful for constructing microarrays which
CC are useful for measuring and for surveying gene expression and creating
CC transgenic non-human animals capable of producing the proteins. The
CC present sequence is that of a scanning oligonucleotide useful in examples
CC of the invention. Note: The present sequence did not form part of the
CC printed specification, but is based on sequence information supplied to
CC Derwent by the European Patent Office

PT Sequencing nucleic acid by mass spectrometric analysis - for detecting
PT nucleic acids, telomerase activity, oncogene mutations, or cancer-
PT specific sequences, for diagnosis of disease.
XX
PS Claim 48; Page 271; 478pp; English.
XX
CC A process has been developed for determining the sequence of a target
CC nucleic acid. The process comprises: (i) generating at least two
CC fragments (F) from the target nucleic acid; and (ii) analysing F by mass
CC spectrometry (MS). The sequences in AAV39483 to AAV39592 are specifically
CC claimed primers for use in the mass spectrometric analysis of the above
CC process. The process is used to detect genetic diseases (e.g.
CC haemophilia, thalassemia, Duchenne muscular dystrophy, Alzheimer's
CC disease, cystic fibrosis and many others) or chromosomal abnormalities
CC (or predisposition); infections and cancers; also for establishing
CC identity and heredity. Particular applications are diagnosis of
CC neuroblastoma, detecting telomerase, determining family relationships and
CC HLA compatibility, and in genetic fingerprinting. Compared with known
CC methods using MS, this process requires fewer specific reagents and is
CC better suited to automation. Extended primers are shorter; primer
CC annealing is more efficient and the process allows detection of many
CC sequences simultaneously

XX Arraying genome clones.
XX
XX Claim 4; Page 46; 528pp; Japanese.
XX
XX The present invention describes a method of arraying genome clones. The
XX method comprises: (a) clones of the genomic libraries contained in
XX multiwell plates numbered for discrimination are mixed in each of the
XX multiwell plates; (b) a primer designed based on the chromosome marker
XX sequence is added to the mixture to carry out an amplification reaction;
XX (c) a signal corresponding to the marker is detected from the resultant
XX amplified product to specify the discrimination Nos. of the multiwell
XX plates containing the clones having said marker sequence; (d) the order
XX of the markers is changed so that the same discrimination Nos. succeed to
XX the maximum in the specified discrimination Nos. to array the multiwell
XX plates; (e) the clones in the multiwell plates of the specified
XX discrimination Nos. are mixed respectively in each wells of longitudinal
XX and lateral directions; (f) the mixed clones are cultured and the
XX resultant cultures are amplified by using the above primer; (g) signals
XX are detected from the amplified products; (h) the clones in the multiwell

```

CC plates are specified from the detected result; and (i) the clones are
 CC reconstructed as the positions on the chromosome and arrayed. The
 CC microarray is useful for gene analysis. ABL42957 to ABL45322 represent
 CC PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634
 CC represent PCR primers for human chromosome 21q22.1, which are
 CC specifically claimed for use in the present invention

 PT Designing capture oligonucleotide probes for use on a support to which
 PT complementary oligonucleotides hybridize with little mismatch.
 XX
 PS Example 5; Fig 29; 300pp; English.
 XX
 CC The present invention describes a method (M1) for designing capture
 CC oligonucleotide probes (I) for use on a support to which complementary
 CC oligonucleotide probes (II) will hybridize with little mismatch, where
 CC (I) have melting temperatures within a narrow range. The method is useful
 CC for detecting infectious diseases caused by bacterial infectious agents
 CC e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal
 CC infectious agents e.g. Cryptococcus neoformans, Candida albicans and
 CC Aspergillus fumigatus, viruses e.g. T-cell lymphocytotropic virus,
 CC Epstein-Barr virus and polio virus, and parasitic infectious agents
 CC selected from Onchocerca volvulus, Entamoeba histolytica and Brucella
 CC melitensis. The method is also useful for detecting genetic diseases such
 CC as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
 CC Detecting cancer involving oncogenes, tumour suppressor genes, or genes
 CC involved in DNA amplification, replication, recombination or repair, the
 CC cancer is specifically associated with a gene selected from BRCA1 gene,
 CC p53 gene, human papillomavirus types 16 and 18 and liver cancers. The
 CC method is also used for environmental monitoring, forensics and the food
 CC and feed industry, detecting comprises scanning (using e.g. a scanning

CC electron microscope and infrared microscope) the support at the
 CC particular sites and identifying if ligation of the oligonucleotide probe
 CC sets occurred and correlating (using a computer) identified ligation to a
 CC presence or absence of the target nucleotide sequences. ABI82074 to
 CC ABI97546 represent oligonucleotide sequences used in the exemplification
 CC of the present invention

XX Sequencing complex genomes, present as fragments in a cosmid library - by
PT sequencing end-specific nucleotides of each clone then correlating with
PT spatial relationship of cosmid, esp. for mammalian chromosomes.
XX Example 4; Page 80; 128pp; English.
XX Sequences were determined from the ends of chromosome 11-specific cosmids
CC by automated sequencing without intermediate subcloning. A sample of 371
CC DNA sequence fragments were determined and of these, 277 were suitable
CC for STS primer prediction by computer analysis (using the "Primer"
CC program available from E.Lander, MIT). The STSs and cosmids were mapped
CC by in situ hybridisation, somatic cell hybrid analysis or both. Using
CC this method, 370 STSs specific for human chromosome 11 were generated and
CC most of them were regionally mapped. This procedure illustrates a novel
CC method for sequencing complex genomes, designated "sequence sampled
CC mapping". The sequence sampled mapping method is useful for the
CC completion of high density sequence-based maps, and ultimately, for the
CC complete sequencing of genomic DNA directly from cosmid clones. See
CC AAQ82001-Q82706 for STS primers. (Also see AAQ91325-58). (Updated on 25-
CC MAR-2003 to correct PN field.)

XX Increasing muscle mass in mammals - by decreasing myostatin expression.
XX Disclosure; Page 13; 75pp; English.
XX
CC This is a downstream primer for inositol polyphosphate-1 phosphatase
CC (INPP1). Comparative anchored tagged sequences (CATs, see AAX24422-
CC AAX24439), i.e. primer pairs that amplify a sequence tagged site from the
CC orthologous gene in different species, were developed for a series of
CC genes flanking Col3A1 on the human map and for which sequence information
CC was available in more than one mammal, in order to refine the
CC correspondence between HSA2q31-33 (human chromosome 2) and BTA2q12-22
CC (bovine chromosome 2). The CATs were used to screen a 6-genome equivalent
CC bovine yeast artificial yeast library by PCR. Genetic, physical and
CC comparative mapping was performed to define the bovine mh (muscular
CC hypertrophy) locus. The invention relates to factors affecting muscle
CC development in mammals, especially to the identification of the bovine
CC myostatin gene (see AAX24415). Cattle homozygous for a mutated myostatin

```

CC gene are double-muscle. Methods for determining muscle hyperplasia in a
CC mammal, and for increasing muscle mass by reducing myostatin expression
CC are provided

PT New short interfering nucleic acid downregulates expression of the c-fos
PT gene useful for treatment and diagnosis of diseases, e.g. cancer and
PT inflammation.

XX Example 3; SEQ ID NO 205; 145pp; English.

CC The invention relates to short interfering nucleic acids (siRNA) which
CC downregulate expression of the human c-fos gene by RNA interference. The
CC siRNAs may or may not comprise ribonucleotides and may be double or single
CC stranded. They further comprise sense and antisense regions, or
CC alternatively are assembled from a sense oligonucleotide and an antisense
CC oligonucleotide. Specifically, the siRNAs include short interfering RNA

CC (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA
CC (shRNA). The siRNAs can be unmodified or chemically modified, can contain
CC deoxyribonucleotides, and can be chemically synthesised, expressed from a
CC vector or enzymatically synthesised. The invention also relates to kits
CC for the in vitro or in vivo delivery of siRNA; conjugates and/or complexes
CC of siRNA; and vectors that express siRNA. The siRNAs are used to modulate
CC expression of the c-fos gene in cells, tissue explants or organisms
CC (e.g., by ex vivo gene therapy), or in grafts and transplants for the
CC treatment of a variety of conditions. They may be used for treating
CC central nervous system lesions and injuries (e.g., Alzheimer's disease,
CC Parkinson's disease, Huntington's disease, epilepsy, dementia or
CC amyotrophic lateral sclerosis); various cancers; other proliferative
CC diseases (e.g., restenosis and polycystic kidney disease); inflammatory
CC and/or allergic diseases; viral infections (including HIV infection);
CC autoimmune diseases; and transplant rejection. The siRNAs are also useful
CC for drug screening, diagnosis, therapeutic target identification and
CC validation, genetic engineering, pharmacogenomics, studying gene
CC function, and gene mapping (e.g., of single nucleotide polymorphisms).
CC The present sequence represents the lower strand of a human c-fos-
CC targeted double-stranded siRNA.

XX
XX Novel nucleic acid which hybridizes with DNA of dechlorination bacteria
XX PT preferentially at chlorinated ethylene-decomposing gene or at position
XX PT upstream of DNA, useful for detecting dechlorination bacteria.
XX
XX Claim 2; Page 17; 60pp; English.
XX
XX The invention relates to a novel nucleic acid which hybridizes with the
XX DNA of dechlorination bacteria preferentially at the chlorinated ethylene
XX decomposing gene or at a position upstream of the DNA. The novel nucleic
XX acid is useful for detecting dechlorination bacteria, by performing a
XX polymerase chain reaction (PCR) using the novel nucleic acid for the
XX primer and the nucleic acid(s) present in the sample bacterium for the
XX template and detecting the synthesized DNA fragments. A labelled probe of
XX the derived from the novel nucleic acid is useful for detecting
XX dechlorination bacteria, by bringing the probe into contact with a sample
XX bacterium or with nucleic acid(s) prepared from such sample bacterium to
XX effect an RNA- or DNA-hybridisation, and detecting the label of the
XX probe. The novel nucleic acid or its probe are useful for detecting high
XX performance dechlorination bacteria, especially those exhibiting high
XX activity of decomposing vinyl chloride. This polynucleotide sequence
XX represents a PCR primer relating to the dechlorination bacteria DNA
XX hybridising nucleic acid of the invention

XX Streptococcus pneumoniae ratC polypeptide and polynucleotide useful for
PT treating bacterial infections, especially meningitis and pneumonia.
XX
PS Disclosure; Page 17; 60pp; English.
XX
XX This sequence is a PCR primer for the Streptococcus pneumoniae ratC DNA
CC of the invention. The ratC protein may be used to screen for its agonists
CC and antagonists by contacting it with a candidate compound and detecting
CC any alteration in the activity of ratC. Alternatively, the effect of a
CC candidate compound on the production of mRNA encoding ratC may be
CC detected using an ELISA assay. Agonists of ratC may be administered to
CC patients to treat conditions associated with increased expression or
CC activity of ratC. Agonists of ratC may similarly be used to treat
CC conditions associated with decreased expression or activity of ratC.
CC Diseases or conditions arising from altered expression or activity of
CC ratC may be diagnosed by detecting ratC in a sample from a patient or
CC detecting a mutation in the ratC coding sequence in the genome of the
CC patient. These diseases or conditions include bacterial infections,
CC especially Streptococcus pneumoniae infections, and Helicobacter pylori
CC infections, otitis media, conjunctivitis, pneumonia, bacteremia,
CC meningitis, sinusitis, pleural empyema, endocarditis, gastric ulcers,
CC gastritis, and gastrointestinal carcinomas. A computer readable medium
CC containing the ratC DNA sequence may be used in a computer based method
CC for performing homology identification, comprising providing the ratC DNA
CC in the computer readable medium and comparing the polynucleotide sequence
CC to at least one polynucleotide or polypeptide sequence to identify
CC homology. The ratC DNA sequence and computer readable medium are also
CC used in a computer based method for polynucleotide assembly, comprising
CC providing ratC in a computer readable medium and screening for at least
CC one overlapping region between a the first and a second polynucleotide
CC sequence

XX Disclosure; Page 11; 43pp; English.
XX
XX The sequence represents PCR primer IFN-gamma sense, used to follow the
CC progress and/or treatment of multiple sclerosis (MS). This is done by
CC determining the amount of following cytokines, interleukin (IL)-18, IL-
CC 12p40, interferon (IFN)-gamma, IL-4, IL-10, transforming growth factor
CC (TGF)-beta, IL-12Rbeta1, IL-12Rbeta2 and/or IL-12p35 of the first
CC biological sample obtained from person suffering from or suspected to
CC suffer from MS, and optionally comparing it with a reference value. This
CC method is useful for determining the success rate of treatment of MS by
CC discriminating between patients with MS (regardless of the clinical
CC subtypes) and healthy controls, on the basis obtained from person
CC suffering from or suspected to suffer from MS. The method enables a
CC clinician to be able to determine or further substantiate the clinical
CC subtype of patient quickly and accurately, and immediately upon the first
CC onset of symptoms

 PT Arraying genome clones.
 XX
 PS Claim 4; Page 40; 528pp; Japanese.
 XX

The present invention describes a method of arraying genome clones. The
 method comprises: (a) clones of the genomic libraries contained in
 multiwell plates numbered for discrimination are mixed in each of the
 multiwell plates; (b) a primer designed based on the chromosome marker
 sequence is added to the mixture to carry out an amplification reaction;
 (c) a signal corresponding to the marker is detected from the resultant
 amplified product to specify the discrimination Nos. of the multiwell
 plates containing the clones having said marker sequence; (d) the order
 of the markers is changed so that the same discrimination Nos. succeed to
 the maximum in the specified discrimination Nos. to array the multiwell
 plates; (e) the clones in the multiwell plates of the specified
 discrimination Nos. are mixed respectively in each wells of longitudinal
 and lateral directions; (f) the mixed clones are cultured and the
 resultant cultures are amplified by using the above primer; (g) signals
 are detected from the amplified products; (h) the clones in the multiwell
 plates are specified from the detected result; and (i) the clones are
 reconstituted as the positions on the chromosome and arrayed. The
 microarray is useful for gene analysis. ABL42957 to ABL45322 represent
 PCR primers for human chromosome lp36-35 DNA, and ABL45323 to ABL45634
 represent PCR primers for human chromosome 21q22.1, which are
 specifically claimed for use in the present invention

 XX

Pharmaceutical composition for treating ailments associated with impaired
 respiration, has oligo(s) antisense to specific gene(s) or its
 corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
 ubiquinone.

Disclosure; SEQ ID NO 2605; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a
 first active agent comprising an oligonucleotide antisense to the
 initiation codon, coding region, 5' or 3' end genomic flanking regions,
 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
 junctions of genes encoding a polypeptide associated with lung and/or
 nasal airway dysfunction and a second active agent comprising an
 antiinflammatory steroid and ubiquinone. A composition of the invention
 has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
 immunosuppressive, and cytostatic activity. The composition may have a
 use in antisense gene therapy. The composition is useful for treating or
 preventing a respiratory, lung or malignant disease or condition, also
 for enhancing the prophylactic or therapeutic respiratory effect of an
 antiinflammatory steroid in a subject, for reducing or depleting levels
 of, or reducing sensitivity to adenosine, reducing levels of adenosine
 receptor, producing bronchodilation, increasing levels of ubiquinone or
 lung surfactant in a subject's tissue, or treating bronchoconstriction,
 lung inflammation, lung allergies, or a respiratory disease or condition.

 Production of antigen loaded dendritic cells, used for developing
 products for treating e.g. cancer or malignancies, microbial infections
 or autoimmune diseases.
 Example 7; Page 71; 165pp; English.
 A method (A) has been developed of delivering antigens to dendritic cells
 (DCs). (A) comprises contacting DCs with apoptotic cells (ACs) expressing
 an antigen where the contact allows the antigen to be internalised by the
 DCs, and where the ACs have been induced in vitro to become apoptotic.
 The DCs can be loaded with antigens such as antigens derived from
 influenza virus, malaria, HIV, EBV, human papilloma virus, CMV, renal
 cell carcinoma antigens, and melanoma antigens. In addition, self
 antigens that are targets of autoimmune responses or other antigens for
 which it is desired to attenuate an immune response can be expressed on
 donor cells using the methods, e.g. insulin, histones or GAD. The
 products can be used for the prophylactic or therapeutic treatment of
 diseases such as e.g. bacterial infections, protozoan infections, such as HIV
 malaria, listeriosis, microbial infections, viral infections, such as HIV
 or influenza, cancers or malignancies such as melanoma, autoimmune
 diseases such as psoriasis and ankylising spondylitis. The present
 sequence represents a PCR primer used to amplify beta-3 from dendritic
 cells used in the exemplification of the present invention

PT New oligo:nucleotide with affinity for non-linear target - includes a
PT sequence preventing canonical interaction but able to form a complex,
PT used to prevent development of viruses, bacteria and parasites.
XX
PS Example 2; Page 21; 48pp; French.
XX
CC The oligonucleotides AAT10455-82 represent examples of novel
CC oligonucleotides designated 'Aptastruc'. The oligonucleotides have
CC affinity for non-linear target sequences e.g a self-annealed hairpin
CC structure. They have a complementary sequence to part of the linear
CC (stem) of the target whereas the remainder (i.e. either end) of the
CC oligonucleotide does not interact with the target sequence. The
CC oligonucleotides presented here are targeted to the TAR region of HIV,
CC which binds to the tat protein during viral development. The novel
CC oligonucleotides are generally targeted to regulatory elements such as a
CC mini-exon from trypanosomes, the HIV TAR or an iron response element.
CC They may either bind to the target sequence to interfere with its
CC regulatory role or may contain a functional group e.g. a ribozyme to
CC cleave the target sequence

XX
PT Detecting a specific nucleic acid target molecule using a repair mediated
PT process.
XX
PS Example 1; Col 14; 33pp; English.
XX
CC Oligonucleotide B is 1 of 4 blunt-ended sequences (see AAZ35292-95) used
CC in an example of the gap-filling/ligating embodiment of a new repair-
CC mediated process for amplifying and detecting nucleic acid sequences. The
CC target was the HIV GAG region 2106-2153 (see AAZ35291). Blunt ends are
CC created after incorporation of 2'-deoxyadenosine 5'-O-(1-
CC thiotriphosphate) (dATP(alpha-S)) at the 3' end of each sequence. A gap
CC of 5 base pairs exists between oligonucleotides A and B or A' and B' when
CC these strands are hybridised to their complementary strand of the target
CC sequence. The amplification process involves treating RNA or separate
CC complementary strands of DNA target with a molar excess of
CC oligonucleotide complement pairs (OCPs), the OCPs having sequences
CC complementary to the target, under hybridising conditions. In one
CC embodiment, the OCPs may have a gap of 1 or more bases which may be
CC repaired (filled) by enzymes. The OCPs are joined together, forming a
CC joined, oligonucleotide product. The target/joined product hybrid nucleic
CC acids are then denatured to single strands again, at which point both the
CC target and the joined products can form hybrids with new OCPs. The steps
CC of the reaction are carried out stepwise or simultaneously and can be
CC repeated as often as desired. The process enables the detection of
CC specific nucleic acid sequences associated with infectious disease,
CC genetic disorders or cellular disorders such as cancer. The length and
CC sequences of the OCPs can be varied to detect deletions and/or mutations
CC in the genomic DNA from any organism. The method is performed using heat-
CC labile enzymes or without any enzymes, and may be automated

PT Detecting a specific nucleic acid target molecule using a repair mediated
 PT process.

PS Example 1; Col 14; 33pp; English.

XX Oligonucleotide P' is 1 of 4 sticky-ended sequences (see AAZ35296-99)
 CC used in an example of the gap-filling/ligating embodiment of a new repair
 CC -mediated process for amplifying and detecting nucleic acid sequences.
 CC The target was the HIV GAG region 2106-2153 (see AAZ35291). The
 CC amplification process involves treating RNA or separate complementary
 CC strands of DNA target with a molar excess of oligonucleotide complement
 CC pairs (OCs), the OCs having sequences complementary to the target,
 CC under hybridising conditions. In one embodiment, the OCs may have a gap
 CC of 1 or more bases which may be repaired (filled) by enzymes. The OCs
 CC are joined together, forming a joined, oligonucleotide product. The
 CC target/joined product hybrid nucleic acids are then denatured to single
 CC strands again, at which point both the target and the joined products can
 CC form hybrids with new OCs. The steps of the reaction are carried out
 CC stepwise or simultaneously and can be repeated as often as desired. The
 CC process enables the detection of specific nucleic acid sequences
 CC associated with infectious disease, genetic disorders or cellular
 CC disorders such as cancer. The length and sequences of the OCs can be
 CC varied to detect deletions and/or mutations in the genomic DNA from any
 CC organism. The method is performed using heat-labile enzymes or without
 CC any enzymes, and may be automated

XX Detecting a specific nucleic acid target molecule using a repair mediated
 PT process.

XX Example 1; Col 14; 33pp; English.

XX Oligonucleotide B' is 1 of 4 blunt-ended sequences (see AAZ35292-95) used
 CC in an example of the gap-filling/ligating embodiment of a new repair-
 CC mediated process for amplifying and detecting nucleic acid sequences. The
 CC target was the HIV GAG region 2106-2153 (see AAZ35291). Blunt ends are
 CC created after incorporation of 2'-deoxyadenosine 5'-O-(1-
 CC thiotriphosphate) (dATP(alpha-S)) at the 3' end of each sequence. A gap
 CC of 5 base pairs exists between oligonucleotides A and B or A' and B' when

CC these strands are hybridised to their complementary strand of the target
 CC sequence. The amplification process involves treating RNA or separate
 CC complementary strands of DNA target with a molar excess of
 CC oligonucleotide complement pairs (OCs), the OCs having sequences
 CC complementary to the target, under hybridising conditions. In one
 CC embodiment, the OCs may have a gap of 1 or more bases which may be
 CC repaired (filled) by enzymes. The OCs are joined together, forming a
 CC joined, oligonucleotide product. The target/joined product hybrid nucleic
 CC acids are then denatured to single strands again, at which point both the
 CC target and the joined products can form hybrids with new OCs. The steps
 CC of the reaction are carried out stepwise or simultaneously and can be
 CC repeated as often as desired. The process enables the detection of
 CC specific nucleic acid sequences associated with infectious disease,
 CC genetic disorders or cellular disorders such as cancer. The length and
 CC sequences of the OCs can be varied to detect deletions and/or mutations
 CC in the genomic DNA from any organism. The method is performed using heat-
 CC labile enzymes or without any enzymes, and may be automated

Novel biallelic markers used to construct a high density disequilibrium
 map of the human genome.

XX Claim 9; Page 2411; 2745pp; English.
 CC
 CC AAZ65654 to AAZ69578 represent human biallelic markers from the present
 CC invention, which contain a polymorphic base at position 24 of their
 CC nucleotide sequences. AAZ69579 to AAZ77440 represent amplification
 CC primers for the biallelic markers. The biallelic markers of the invention
 CC have a variety of uses: they can be used for high density mapping of the
 CC human genome, and in complex association studies and haplotyping studies

CC which are useful in determining the genetic basis for disease states.
 CC Compositions and methods of the invention can also be useful for the
 CC identification of the targets for the development of pharmaceutical
 CC agents and diagnostic methods, as well as the characterisation of the
 CC differential efficacious responses to and side effects from
 CC pharmaceutical agents acting on a disease as well as other treatment.

Novel dual-specificity mitogen activated protein kinase phosphatase
 polypeptide useful in screening assays for identifying agents that
 modulate activity of the protein which are useful for treating cancer and
 autoimmune diseases.
 XX
 PS Example 1; Page 46; 60pp; English.
 XX
 CC The invention relates to a human dual-specificity mitogen-activated
 CC protein (MAP) kinase phosphatase, DSP-3, and to nucleic acids encoding
 CC it. The invention also relates to variants of DSP-3 which retain
 CC activity, expression vectors and host cells comprising DSP-3-encoding
 CC DNA, the recombinant production of DSP-3, an anti-DSP-3 antibody, and a
 CC DSP-3 substrate-trapping mutant protein that has a reduced ability to
 CC dephosphorylate a substrate relative to the wild-type DSP-3. The
 CC invention additionally encompasses use of a DSP-3 modulator to modulate a
 CC proliferative response, cell differentiation or cell survival. The DSP-3

CC protein is useful for screening an agent that binds to DSP-3 and/or
 CC modulates DSP-3 activity, and is also useful for raising antibodies. DNA
 CC encoding DSP-3 or a reporter protein is also useful for screening an
 CC agent that modulates DSP-3 activity. The identified agents that modulate
 CC DSP-3 activity are useful for treating Duchenne muscular dystrophy,
 CC cancer, graft-versus-host disease, autoimmune diseases, allergies,
 CC metabolic diseases, abnormal cell growth, abnormal cell proliferation and
 CC cell cycle abnormalities. DSP-3-specific antibodies and DSP-3 antisense
 CC probes are useful for detecting DSP-3 expression in a sample. The present
 CC sequence represents a human DSP-3 RACE (rapid amplification of cDNA ends)
 CC PCR primer used in an exemplification of the invention

XX New dual-specificity phosphatase (DSP)-3 and DSP-3 alternate form
 PT polypeptides, useful for identifying modulators DSP-3 or DSP-3 alternate
 PT form activity, especially for treating e.g. cancer, autoimmune diseases
 PT or allergies.

XX Example 1; Page 48; 86pp; English.

XX The present sequence is given in a specification providing human dual
 CC specificity phosphatase-3 (DSP-3) and a murine DSP-3 variant polypeptide.
 CC The polypeptides are useful for dephosphorylating a substrate of DSP-3,
 CC e.g. MAP-kinase. They may be used to treat or prevent diseases associated
 CC with cell proliferation, immunosuppression, metabolic diseases, or
 CC abnormal cell growth or cell cycle abnormalities. They are also useful
 CC for identifying agents that modulate their activity. The modulators are
 CC useful for treating disorders associated with DSP-3 or DSP-3 variant
 CC activity, e.g. Duchenne muscular dystrophy, cancer, graft-versus-host

CC disease, autoimmune diseases, allergies, metabolic diseases, abnormal
 CC cell growth, abnormal cell proliferation and cell cycle abnormalities.
 CC The modulating agents are useful for modulating, modifying or altering
 CC cellular responses, e.g. in vivo or in vitro cell proliferation,
 CC differentiation or survival

PT Inhibiting neoplastic cellular proliferation and/or transformation of a
PT mammalian cell, by using Pituitary tumor transforming gene carboxy-
PT terminal peptides.
XX
PS Example 21; Page 103; 190pp; English.
XX
CC The patent discloses pituitary tumour transforming gene (PTTG) carboxy
CC terminal peptides. The invention also relates to methods for inhibiting
CC neoplastic cellular proliferation and transformation (NP/T) of mammalian
CC cells. The method involves delivering a composition comprising a PTTG
CC carboxy-terminal-related polynucleotide, an expression vector comprising
CC a polynucleotide encoding PTTG C-terminal (PTTG-C) peptide, PTTG-C
CC peptide to a mammalian cell that overexpresses PTTG. The compositions
CC comprising PTTG-C peptides are useful for inhibiting neoplastic cellular
CC proliferation and/or transformation of a mammalian cell. PTTG-C peptides
CC are useful in bioassays, as immunogens to produce anti-PTTG-C antibodies
CC and in therapeutic compositions. PTTG antibodies are also useful for
CC inhibiting the activation of mammalian T-lymphocytes. Sequences of the
CC invention are used as vaccines and in gene therapy. The present sequence
CC is a PCR primer which is used for amplifying human PTTG gene

XX Novel method of inhibiting neoplastic cellular proliferation and/or
XX transformation of a mammalian cell used for treating e.g. malignant
XX tumours.
XX
XX Example 21; Page 99; 175pp; English.
XX
XX The present invention describes a method for inhibiting neoplastic
XX cellular proliferation and/or transformation of a mammalian cell. The
XX method comprises delivering to a mammalian cell that endogenously over
XX expresses pituitary tumour transforming gene (PTTG1), a composition
XX comprising an expression vector comprising a promoter and a
XX polynucleotide, where the polynucleotide comprises a first DNA segment
XX encoding a mammalian PTTG2 peptide the polynucleotide being operatively
XX linked to the promoter in a transcriptional unit, where PTTG2 is selected
XX from: (a) a peptide (1) consisting essentially of a 191 amino acid
XX sequence (see ABB79058) or a functional fragment comprising at least
XX amino acid residues 1-180; or (b) a mammalian PTTG2 peptide having at
XX least 95% sequence homology with (1). The expression vector is complexed
XX with a cellular uptake-enhancing agent such that the PTTG2 peptide is
XX expressed in the cell where neoplastic cellular proliferation and/or
XX transformation of the cell is inhibited. PTTG2 protein regulates
XX transactivating activity by PTTG1 and that PTTG2 peptide molecules have
XX the ability to down regulate PTTG1 gene expression and/or PTTG1 protein
XX function in a negative manner. The method is useful in inhibiting
XX neoplastic cellular proliferation and/or transformation of mammalian
XX cells both in vivo and in vitro. The method is also useful in treating
XX malignant tumours. The present sequence represents a PCR primer which is
XX used in an example from the present invention

XX
XX Inhibiting the activation of a mammalian T-lymphocyte cell useful for
XX treating immune-related disorders by inhibiting PTTG1 gene expression.
XX
XX Example 21; Page 103; 185pp; English.
XX
XX The invention relates to inhibiting the activation of a mammalian T-
XX lymphocyte cell comprising inhibiting pituitary tumour transforming gene
XX (PTTG1) expression and/or endogenous PTTG1 protein function in the T-
XX lymphocyte cell, whereby activation of the T-lymphocyte cell is
XX inhibited. PTTG1 upregulates bFGF secretion and transactivates DNA
XX transcription. Compositions and methods of the invention are useful for
XX inhibiting neoplastic and non-neoplastic proliferation of mammalian T-
XX lymphocyte cells, including activated normal lymphocytes and transformed
XX lymphocytes. The compositions and methods are useful in the prevention or
XX inhibition of xenograft or allograft rejection and in the treatment of
XX allergic, asthmatic and/or autoimmune conditions such as systemic lupus
XX erythematosus (SLE), autoimmune myasthenia gravis, rheumatoid arthritis,
XX autoimmune encephalomyelitis, psoriasis, atherosclerosis and other
XX autoimmune diseases. The inventive methods and compositions are also
XX useful in the treatment of T-cell neoplasias, such as leukaemia, or any
XX haematologic or lymphoproliferative neoplasm e.g. Hodgkin's disease. The
XX present sequence is that of a PTTG related PCR primer, useful in methods
XX of the invention

XX PT Novel human membrane associated or secreted polypeptides and
XX PT polynucleotides useful for diagnosis, prevention and treatment of
XX PT pathological states such as cancer, immune, cardiovascular and
XX PT neurological disorders.
XX PS Example 6; Page 97; 151pp; English.
XX CC The invention relates to human SECX proteins (AAB23029-B23048) and to
XX CC nucleic acids which encode them (AAA93616-A93631, AAA93673-A93676). The
XX CC SECX proteins of the invention are either secreted or membrane-associated
XX CC proteins and act as regulator of cellular proliferation and
XX CC differentiation. SECX proteins or nucleotides are useful for diagnosing
XX CC the presence of, or predisposition to, a disease associated with altered
XX CC levels of SECX proteins and nucleotides. The SECX proteins are also
XX CC useful to screen compounds that modulate SECX activity or expression. The
XX CC interaction of a SECX protein with other cellular proteins may be useful
XX CC to modulate the activity of a partner protein, cellular proliferation,
XX CC cellular differentiation and cell survival. SECX nucleotides are useful
XX CC for the recombinant expression of SECX protein, and may also be used to
XX CC modulate SECX expression (e.g., using antisense oligonucleotides). SECX
XX CC nucleic acid sequences are also useful for identifying a cell or tissue
XX CC type in a biological sample, and in forensic biology. SECX primers or
XX CC probes are useful for detecting the presence of SECX nucleotides and for
XX CC screening tissue cultures for contamination. Diseases that may be treated
XX CC or prevented using SECX proteins or nucleotides include cancer (e.g.,
XX CC colorectal carcinoma, prostate cancer), benign tumours, immune disorders
XX CC (including autoimmune diseases, transplant rejection, allergies, AIDS),
XX CC infections, inflammatory disorders, arthritis, haematopoietic disorders,
XX CC skin disorders, cardiovascular disorders, atherosclerosis, restenosis,
XX CC neurological diseases (e.g., Alzheimer's disease), trauma (e.g., surgical
XX CC or traumatic wounds, spinal cord injury), and skeletal disorders. The
XX CC present sequence represents a SECX primer used in real-time quantitative
XX CC PCR expression analysis of a SECX gene in an exemplification of the
XX CC invention.

Nucleic acids comprising single nucleotide polymorphisms, useful in
applications such as forensics, paternity testing, medicine, genetic
analysis and phenotype correlations to diseases such as diabetes and
atherosclerosis.
Example; Page 59; 242pp; English.
The present invention provides a method of diagnosing a vascular disease
in an individual, involving determining the sequence at various
polymorphic sites within the human thrombospondin 1 and thrombospondin 4
genes. The sequences at a number of polymorphic sites are also provided
in the specification. In particular, the method can be used in the
diagnosis of atherosclerosis, myocardial infarction, coronary heart
disease, stroke, peripheral vascular diseases, venous thromboembolism and
pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also
useful in forensics, paternity testing, genetic analysis and phenotype
correlations to diseases. The present sequence is an example of one of
the human gene SNPs shown in the specification

 XX
 This sequence represents a primer used to analyse the human endogenous
 retrovirus (HERV) W genome (AAX25665). Nucleic acids, their fragments or
 peptides encoded by them derived from the HERV-W genome are markers of
 autoimmune disease (e.g. multiple sclerosis, rheumatoid polyarthrititis,
 disseminated lupus erythematosus, insulin-dependent diabetes and related
 pathologies) and of abnormal or unsuccessful pregnancy and can be used as
 CC chromosomal markers for susceptibility to these conditions, or proximity
 CC markers of genes associated with this susceptibility

 XX
 XX Disclosure; Page 1507; 1755pp; English.
 XX
 XX PCR primers AAZ01426-Z06209 were used to amplify open reading frames
 CC (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs
 CC encode polypeptides (see AAY36754-Y37949) which can be used as vaccines
 CC against Chlamydia trachomatis. Antisense and ribozyme sequences can also
 CC be used to control growth of the microorganism. Chlamydia trachomatis is
 CC responsible for a large number of diseases, e.g. eye diseases such as
 CC conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion
 CC conjunctivitis; genital diseases such as nongonococcal urethritis,
 CC epididymitis, cervicitis, salpingitis, perihhepatitis, bartholinitis;
 CC pneumopathy in breast feeding infants; and venereal lymphogranulomatosis.
 CC The polypeptides of the invention may be of use in treating these
 CC diseases

XX Oligonucleotide for treating diseases associated with human tumor

PT necrosis factor-alpha (TNF-alpha) such as, diabetes and rheumatoid

PT arthritis, comprises nucleotide sequence complementary to intron of

PT nucleic acid encoding TNF-alpha.

XX

PS Example 22; Page 103; 283pp; English.

XX

CC This sequence represents an antisense oligonucleotide sequence which

CC targets a region of the human tumour necrosis factor alpha (TNFalpha)

CC nucleotide sequence. TNFalpha is an important cytokine that plays a role

CC in host defence. It is produced mainly in macrophages and monocytes in

CC response to infection, invasion, injury or inflammation. Overexpression

CC of TNFalpha can result in disease states, particularly in infectious,

CC inflammatory and autoimmune diseases. The invention relates to antisense

CC oligonucleotides, such as that represented by the present sequence which

CC are capable of modulating the TNFalpha gene expression. The

CC oligonucleotides optionally have a phosphorothioate backbone, and may

CC also optionally contain at least one 2'-O-methoxyethyl modification. The

CC oligonucleotides are useful for modulating the expression of human

CC TNFalpha in cells and tissues, reducing a human cell inflammatory

CC response, reducing the blood glucose level in a human and treating a

CC human having a disease or condition associated with TNFalpha. Examples of

CC diseases associated with TNFalpha include diabetes, inflammatory bowel

CC disease, multiple sclerosis, pancreatitis, rheumatoid arthritis,

CC infectious disease, hepatitis, atopic dermatitis or allograft rejection.

CC The antisense oligonucleotides are also useful for modulating the

CC function of a selected nucleic acid sequence in adipose tissue

XX

PS Disclosure; Page 11; 29pp; English.

XX

CC This sequence represents a PCR primer for the Survivin gene. The

CC invention relates to an assay system for identifying the product or

CC products of, in combination, the pancreas regenerating gene (REG) and the

CC Survivin gene (an anti-apoptosis gene) for determining the tendency of a

CC tissue to become cancerous or for determining the aggressive nature of an

CC existing cancer. The assay determines the tendency of a tissue to become

CC cancerous or the aggressive nature of cancer tissue by using the gene

CC products of the REG and Survivin genes. It is also used for diagnosing a

CC patient, preferably having colorectal cancer for adjuvant therapy. These

CC combined marker genes (REG and Survivin) are also used for screening

CC individuals for clinical trial to detect drug efficacy. The assay

CC identifies patients who can be given a benign clinical course and thus

CC they are spared from unpleasant side effects of adjuvant therapy which is

CC also cost saving. The aggressive nature of other cancers can be

CC identified and thus allows significant development in the treatment of

CC these patients

PS

XX The present invention is concerned with a number of secreted proteins and
CC their coding sequences isolated from various human cDNA libraries. The
CC probes shown in the specification (AA93132-A93156) can be used to obtain
CC the cloned sequences from bacterial cells. The proteins and coding
CC sequences can be used in the isolation of similar genes and proteins, in
CC the elucidation of their function in vivo, and to treat a number of
CC conditions. It is possible that they may have uses as nutritional
CC supplements, as cytokine or cell proliferation factors, in immune
CC modulation, where they may be used to treat immune and autoimmune
CC diseases, as haematopoiesis regulators (treating myeloid or lymphoid cell
CC deficiencies), in the promotion of tissue growth, they may have chemokine
CC or chemotactic activity, haemostatic or thrombolytic activity, or anti-
CC inflammatory activity

XX

CC The invention relates to primers for synthesising full length cDNA
CC clones. 830 cDNA molecules encoding a human protein have been isolated
CC and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have
CC been determined. Primers for synthesising the full length cDNA are useful
CC for clarifying the function of the protein encoded by the cDNA. The full
CC length clones were obtained by construction of full length enriched cDNA
CC libraries that were synthesised by the oligo-capping method. The primers
CC enable the production of the full length cDNA easily without any special
CC methods. The present sequence is a primer used to amplify a human cDNA
CC clone provided in the invention

CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antinflammatory steroid and ubiqunone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiqunone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequences

 PT Treating inflammatory disorders such as inflammatory bowel disease,
 PT Crohn's disease or rheumatoid arthritis, in a subject, by administering
 PT oligonucleotide which inhibits expression of human tumor necrosis factor
 PT alpha.
 XX
 PS Example 24; Page 39; 142pp; English.
 XX
 CC The invention describes a method of treating an inflammatory disorder in
 CC an individual, comprising administering to the individual an
 CC oligonucleotide upto 30 nucleotides in length complementary to a nucleic
 CC acid molecule encoding human tumor necrosis factor (TNF)-alpha. The
 CC method is useful for treating an inflammatory disorder such as
 CC inflammatory bowel disease, Crohn's disease, colitis or rheumatoid
 CC arthritis, in an individual. The method is also useful for treating
 CC diabetes, pancreatitis, multiple sclerosis, atopic dermatitis, asthma,
 CC and hepatitis in an individual. This sequence represents an antisense
 CC oligonucleotide used to modulate expression of tumor necrosis factor
 CC alpha (TNF-alpha)

 XX

CC AAT47816-T47827 are PCR primers used for the isolation of the NF2
 CC (neurofibromatosis type 2) gene from various human tumours. NF2 is an
 CC autosomal, dominantly inherited disorder characterised by multiple
 CC tumours of the central nervous system, predominantly bilateral vestibular
 CC schwannomas (acoustic neuromas) of the eighth cranial nerve. Other
 CC symptoms of NF2 include cranial meningiomas, spinal nerve root
 CC schwannomas and presenile lens opacities. The NF2 gene, mapped to
 CC chromosomal region 22q12 between the loci D22S1 and D22S28, acts a tumour
 CC suppressor. The NF2 gene is alternatively spliced resulting in three
 CC different isoforms encoding three different proteins, merlin isoforms I-
 CC III, which are likely to have differing functions. Merlin stands for
 CC moesin-erzin-radixin like protein, so called due to substantial homology
 CC with these three proteins. The NF2 gene isoforms and proteins encoded by
 CC them, are useful in diagnosing NF2 disease. Merlin protein products act
 CC as tumour suppressors and can be used to suppress tumour growth, as can
 CC the cDNA sequence in gene therapy applications. Antibodies raised against
 CC merlin proteins are useful as tumour targeting agents

 CC Nucleic acid associated with autosomal dwarfism in poultry - localised
 PT close to micro-satellite marker LEI146 on chromosome 1, useful e.g. to
 PT produce probes to identify homozygous birds for breeding.
 XX
 PS Disclosure; Fig 2; 53pp; English.
 XX
 CC AAV49739-V49768 are PCR primers used in the amplification of
 CC microsatellite markers around a novel HMGI-c protein isolated from
 CC chicken which is associated with autosomal dwarfism in poultry and can be
 CC used to produce probes for detecting alleles of a gene responsible for
 CC autosomal dwarfism. The Hmgi-c gene is responsible for the pygmy trait in
 CC mice and is also present (although not associated with a dwarf syndrome)
 CC in humans, and was identified as a likely candidate for the autosomal
 CC dwarfism gene in chickens. Probes or microsatellite markers may thus be

CC used to select birds which are homozygous/heterozygous for the autosomal
 CC dwarf allele, since this distinction is not possible phenotypically.
 CC Breeding lines consisting of dwarf birds can then be produced by
 CC selecting birds homozygous for the dwarf allele, useful in breeding
 CC methods involving crossing birds from the breeding line with non-dwarf
 CC birds especially to produce broiler birds

 PT Proteins from neurofibromatosis type 2 transcript isoforms - used for
 PT diagnosis or inhibition of tumors, and generation of antibodies.

XX
 PS Example; Col 14; 45pp; English.
 XX
 CC The present invention describes neurofibromatosis type 2 (NF2) transcript
 CC isoforms. NF2 polynucleotides can be used for diagnosing NF2 diseases,
 CC for inhibiting growth of tumors associated with NF2 mutations (including
 CC expression from cDNA introduced in gene therapy vectors) and to raise
 CC antibodies (useful as tumour targeting agents, since specific isoforms
 CC are often tumour-specific) and as immunoassay reagents for detecting NF2-
 CC expression products. NF2 is a tumour suppressor protein, and so has
 CC anticancer activity. The present sequence represents a PCR primer for
 CC mouse NF2, from an example of the present invention

 PT Identifying binding molecules for ligands, particularly tumour antigens -
 PT by selectively immobilising a population of binding molecules to a solid
 PT support and screening for binding to two or more ligands.
 XX
 PS Example 5; Page 54; 80pp; English.
 XX
 CC This sequence is a primer for DNA encoding a light chain complementarity
 CC determining region (CDR) from a tumour antigen specific antibody. The
 CC invention relates to a method for identifying a binding molecule having
 CC selective affinity for a ligand comprising: (a) selectively immobilising
 CC a diverse population of binding molecules to a solid support; (b)
 CC simultaneously contacting the diverse population immobilised on the solid
 CC support with 2 or more ligands; and (c) determining at least one binding
 CC molecule which selectively binds to one or more of the ligands. The
 CC method allows for the rapid and efficient methods for the identification
 CC of binding molecules which exhibit selective affinity for one or more
 CC ligands of interest. They are used particularly for identifying tumour-
 CC specific binding polypeptides which can be used as targeting agents for
 CC cancer therapy that minimises impact on non-tumour tissues

 XX Example 1; Page 8; 26pp; Chinese.
 PS
 XX This invention relates to a full length provirus genomic DNA sequence
 CC AAC66281 of equine infectious anemia virus (EIAV) from the donkey
 CC leukocyte strain. Included in the invention are the gag, pol, env, rev,
 CC tat, and s2 gene sequences AAC66314 - AAC66319 and their encoded proteins
 CC AAC635754 - AAB35759. The invention also relates to PCR primers AAC66282 -
 CC AAC66288 which are used to isolate the EIAV DNA sequences. Other primers
 CC represented in AAC66289 - AAC66313 are also used in the course of the
 CC invention for the isolation and characterisation of the DNA sequences
 CC identified in the invention. The genes and proteins can be used for
 CC preparing gene mutation and deletion vaccines, DNA vaccines and
 CC diagnostics and in producing an equine infectious anemia virus gene
 CC transfer system for gene therapy. The proteins and polynucleotides may
 CC also be used in the study of HIV

 XX Detecting and differentiating between colon cell proliferative disorders
 PT associated with a gene or its regulatory regions comprises contacting a
 PT target nucleic acid in a biological sample obtained from the subject with
 PT a reagent.
 XX Claim 15; Page 26; 74pp; English.
 XX The invention relates to a novel method for detecting and differentiating
 CC between colon cell proliferative disorders associated with at least one
 CC gene or its regulatory regions. The method comprises contacting a target
 CC nucleic acid in a biological sample obtained from the subject with at
 CC least one reagent or a series of reagents, where the reagent or series of
 CC reagents, distinguishes between methylated and non methylated CpG
 CC dinucleotides within the target nucleic acid. The molecules of the
 CC invention demonstrate cytostatic activity whilst the method may useful
 CC for detecting and differentiating between colon cell proliferative
 CC disorders, including cancers such as colon adenoma and colon carcinoma.
 CC The PNA (peptide nucleic acid)-oligomers are useful as probes for
 CC determining cytosine methylation state or single nucleotide
 CC polymorphisms. The current sequence is that of the PCR primer of the
 CC invention which was used to amplify the genomic DNA region.

 XX Identifying binding molecules having selective affinity for ligands for
 PT discovering reagents for treating diseases, by contacting solid support

PT coated with anti-immunoglobulin reagent to a phage expressed antibody
 PT library.
 XX Example 5; Page 14; 26pp; English.
 XX The present invention relates to a method for identifying a binding
 CC molecule having selective affinity for a ligand. The method involves
 CC providing a solid support coated with an anti-immunoglobulin reagent, and
 CC a phage expressed antibody library, and contacting the solid support to
 CC the phage expressed antibody library. The invention also discloses a
 CC method for identifying an antibody having selective affinity for a
 CC tumour, and a complementarity determining region (CDR) of an antibody
 CC selective for a tumour antigen. The methods of the invention are useful
 CC for identifying a binding molecule having selective affinity for a
 CC ligand, for the discovery of specific reagents for diagnosis and
 CC treatment of human diseases, for identifying binding molecules to, for
 CC example tumour cells or other cellular pathologies for the selective
 CC targeting of therapeutic agents, or for the identification of binding
 CC molecules to normal or diseased tissues for the selective targeting of,
 CC for example diagnostic agents such as imaging reagents. The methods are
 CC rapid and efficient for the identification of binding molecules which
 CC exhibit selective affinity for one or more ligands of interest. The
 CC methods allow the simultaneous screening of multiple binding molecules
 CC against multiple ligands of interest. Moreover, very little information
 CC is required regarding the identity or function of either the binding
 CC molecule or the ligand. For example diverse populations of binding
 CC molecules can be simultaneously screened against diverse populations of
 CC ligands to rapidly identify numerous molecules exhibiting a desired
 CC binding specificity. The methods provide improved sensitivity and
 CC specificity of detection through the selective immobilisation of the
 CC binding molecule population on a solid support. The present sequence
 CC represents a sequencing primer used in the examples of the present
 CC invention.

CC Sequences AAH84132-AAH84370 represent human nucleic acid sequences which
CC protect against cell death (i.e., apoptosis or necrosis). Sequences
CC AAH84132, AAH84145, AAH84170, AAH84201, AAH84210, AAH84226, AAH84285,
CC AAH84281, AAH84315 and AAH84367 represent 10 full-length cDNA clones,
CC while the remaining nucleic acid sequences within the range given above
CC represent the open reading frames (ORFs) of these cDNA clones. Sequences
CC AAH84132-AAH84367 represent the polypeptides encoded by the cell death
CC protective ORFs. The cell death protective cDNA clones are able to
CC prevent, delay or reverse progression through the apoptotic or necrotic
CC pathways when injected into a cell predisposed to or undergoing cell
CC death. The cell death protective nucleic acids and polypeptides can be
CC used in the diagnosis and treatment of disorders associated with cell
CC death, and to screen for compounds which modulate their activity or
CC expression. Such modulators, preferably a small organic molecule, an
CC antibody, a ribozyme, or an antisense molecule, can also be used to treat
CC cell death-related diseases. Such diseases include those associated with
CC the central nervous system including psychiatric or neurological
CC disorders, especially ischaemia-related conditions such as strokes, and
CC also includes neurodegenerative disorders such as Alzheimer's disease,
CC Huntington's disease, or Parkinson's disease. The modulators may also be
CC used to treat infections such as meningitis, malaria, or trypanosomiasis;
CC vascular diseases such as ischaemic encephalopathy or cerebral infarction
CC; eye conditions such as diabetic retinopathy or macular degeneration;
CC hypertension; myocardial infarction; atherosclerosis; respiratory
CC conditions such as asthma or chronic obstructive pulmonary disease;
CC neoplastic conditions such as cancers or benign tumours; blood cell
CC conditions such as anaemia; gastrointestinal conditions such as gastritis
CC or ulcerative colitis; liver conditions such as biliary cirrhosis; kidney
CC disorders such as glomerulonephritis; cystitis; endometriosis; skin
CC disorders such as Grave's disease or Hashimoto's thyroiditis; skin
CC conditions such as dermatitis or urticaria; or immune system disorders
CC such as acquired immunodeficiency syndrome (AIDS). The nucleic acids may
CC additionally be used to generate animal models of cell death-associated
CC disorders. The present sequence represents a cell death protective ORF

PT Detection of nephropathy in mammals - by comparing integrin subunit
PT expression in a tissue sample compared to a control tissue sample.
XX
PS Example 6; Page 35; 73pp; English.
XX
CC AAAT80030-T80035 represent amplification primers for the alpha1 integrin
CC coding sequence. The primers represented in AAAT80036-T80041 are used for
CC the amplification of the alpha2 integrin coding sequence. These sequences
CC can be used in the method of the invention. The method of the invention
CC is for the identification of a mammal having, or at risk of developing,
CC glomerulopathy. The method comprises analysing a tissue sample from a
CC mammal known to contain cells expressing integrin RNA or protein for
CC integrin subunit expression. The integrin subunit expression in the
CC sample is then compared with a control tissue sample, where altered
CC integrin subunit expression is correlated with glomerulopathy. The method
CC can be modified to identify a mammal with diabetes who has, or is at risk
CC of developing, secondary pathological changes associated with diabetes.
CC An increase in alpha2,3,5 or beta-1 integrin expression and/or a decrease
CC in alpha1 expression is diagnostic of increased risk of nephropathy. The
CC methods can be used to determine if patients are likely to develop severe
CC nephropathy and to monitor progress of disease during treatment protocols

 Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.
 Claim 88; Page 66; 200pp; English.
 The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a VGY motif). The CD20-targeting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg²⁺. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targeting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-targeting nucleic acid is used to cleave RNA of the NOGO gene in the presence of a divalent cation that is preferably Mg²⁺. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targeting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present sequence is a hammerhead ribozyme of the invention

 XX Identifying unknown allele(s) of a polyallelic gene using panel of
 XX probes each recognising a sequence motif present in some allele(s) -
 XX useful for donor matching in tissue transplantation.
 XX Claim 5; Page 19; 64pp; English.

A novel method has been developed for identifying an unknown allele of a
 polyallelic gene. The method involves: (a) contacting the unknown allele
 with a panel of probes, each of which recognises a sequence motif that is
 present in some alleles of the polyallelic gene but not in others; (b)
 observing which probes recognise the unknown allele so as to obtain a
 fingerprint of the unknown allele; and (c) comparing the fingerprint with
 fingerprints of known alleles. The present sequence represents a
 specifically claimed probe for use in the method where the polyallelic

CC gene is a human leukocyte antigen class I gene. The method can be used
 CC for genes such as mammalian MHC genes, specifically the HLA class I and
 CC II genes, the T cell receptor genes in mammals, TAP, LMP, ras,
 CC nonclassical HLA class I genes, human complement factor genes C4 and C2,
 CC Bf in the HLA complex, and genes located in mitochondrial DNA, bacterial
 CC chromosomes and viral DNA. The method is particularly useful for matching
 CC the alleles of the HLA genes in a prospective donor and a prospective
 CC recipient in tissue or organ transplantations. The method can also be
 CC used in paternity testing, in forensic medicine, as a follow up technique
 CC in treatment of haematological malignancies or inherited disorders, in
 CC adoptive immunotherapy, and in identification of bacteria and viruses.
 CC The method can provide for the identification of alleles of the
 CC polyallelic genes using a limited number of selected recurring motif
 CC probes

PT Detecting and differentiating between hematopoietic cell proliferative

disorders, comprises contacting a target nucleic acid with a reagent that

distinguishes between methylated and non-methylated CpG dinucleotides.

XX

PS Claim 15; Page 69; 117pp; English.

XX

CC The present invention describes a method for detecting and

CC differentiating between haematopoietic cell proliferative disorders

CC associated with at least 1 gene and/or their regulatory regions in a

CC subject. The method comprises contacting a target nucleic acid in a

CC biological sample obtained from the subject with at least 1 reagent,

CC which distinguishes between methylated and non-methylated CpG

CC dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118

CC represent specifically claimed nucleotide sequences from the present

CC invention. Oligonucleotides from the present invention can be used for

CC differentiating between healthy haematopoietic cells and proliferative

CC disorder haematopoietic cells; for differentiating between acute

CC lymphocytic leukaemia and acute myelogenous leukaemia; as probes for

CC determining the cytosine methylation state and/or single nucleotide

CC polymorphisms (SNPs) of haematopoietic cell proliferation disorder

CC related sequences and their complements; and as primers for the

CC amplification of haematopoietic cell proliferation disorder related DNA

CC sequences. The nucleotide sequences from the present invention can also

CC be used for detecting a predisposition to, differentiation between

CC subclasses, diagnosis, prognosis, treatment and/or monitoring of

CC haematopoietic cell proliferative disorders. The present method enables a

CC highly specific classification of haematopoietic cell proliferation
 CC disorders allowing for improved and informed treatment of patients

 XX Activating double stranded RNA dependent protein kinase in targeted cell
 PT population, by hybridizing antisense RNA with sequence at single genetic
 PT locus in the population, that is absent in non-targeted population.
 XX Example 7; Page 23; 54pp; English.
 XX The present invention relates to a method for selective killing of cells
 CC in a targeted cell population by selectively activating double stranded
 CC (ds) RNA dependent protein kinase (PKR). The method involves selecting
 CC sequence at single genetic locus in targeted cell population that is
 CC absent from equivalent locus in non-targeted cell population, obtaining
 CC anti-sense RNA having sequence homology with the genetic locus, and
 CC permitting anti-sense RNA to hybridise with the RNA transcribed from the
 CC genetic locus to form contiguous dsRNA for activating PKR. The method is
 CC also used for treating proliferative disorders such as neoplastic
 CC disease, psoriasis and vasculogenesis or angiogenesis. The present
 CC sequence is a PCR primer which is used in targeted cell killing in
 CC lymphoma cells

 PS Example 3; Page 118; 143pp; English.
 XX
 CC The present invention describes a short interfering nucleic acid (siNA)
 that downregulates expression of a protein kinase C-alpha (PKC-alpha)
 gene by RNA interference. Also described: (1) a siNA that modulates
 expression and/or activity of genes for other isoforms of PKC or genes
 involved in the PKC pathway; (2) kits for in vitro or in vivo delivery of
 siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that
 express siNA. The siNA sequences have cytostatic, vasotropic and
 nephrotropic activities, and can be used in the modulation (inhibition)
 of expression of the PKC-alpha gene by RNA interference. The siNA can be
 used to modulate expression of PKC-alpha genes. They are potentially
 useful in treating a variety of cancers including e.g. breast cancer,
 cancers of the head and neck, ovarian cancer, lung cancer, prostate
 cancer, and glioblastoma and for treating other proliferative diseases
 and conditions, such as restenosis and polycystic kidney disease. The
 siNA may also be useful for diagnosis, drug screening, target
 identification and validation, genetic engineering, studying gene
 function, and for gene mapping (e.g. of single-nucleotide polymorphisms).
 The present sequence represents a human PKC-alpha siNA, which is used in
 the exemplification of the present invention.

PT Sequencing complex genomes, present as fragments in a cosmid library - by
PT sequencing end-specific nucleotides of each clone then correlating with
PT spatial relationship of cosmid, esp. for mammalian chromosomes.
XX
PS Example 4; Page 86; 128pp; English.
XX
CC Sequences were determined from the ends of chromosome 11-specific cosmids
CC by automated sequencing without intermediate subcloning. A sample of 371
CC DNA sequence fragments were determined and of these, 277 were suitable
CC for STS primer prediction by computer analysis (using the "Primer"
CC program available from E.Lander, MIT). The STSs and cosmids were mapped
CC by in situ hybridisation, somatic cell hybrid analysis or both. Using
CC this method, 370 STSs specific for human chromosome 11 were generated and
CC most of them were regionally mapped. This procedure illustrates a novel
CC method for sequencing complex genomes, designated "sequence sampled
CC mapping". The sequence sampled mapping method is useful for the
CC completion of high density sequence-based maps, and ultimately, for the
CC complete sequencing of genomic DNA directly from cosmid clones. See
CC AAQ82001-Q82706 for STS primers. (Also see AAQ91325-58). (Updated on 25-
CC MAR-2003 to correct PN field.)

 PT Simple, rapid and accurate method for distinguishing HLA class I allele
 PT type with possibility of mechanization and automation, applicable in
 PT judging donor-recipient compatibility during organ transplant and disease
 PT diagnosis.
 XX
 XX Claim 8; Page 60; 83pp; Japanese.
 XX
 CC The present invention describes a method for distinguishing a human
 CC leukocyte antigen (HLA) class I antigen or allele by a combination of
 CC polymerase chain reaction (PCR) using a primer pair whereby all HLA-A, -B
 CC or -C alleles can be amplified or using reverse hybridisation analysis
 CC comprising a DNA probe covalently bonded to microtitre plate wells which
 CC are hybridisable specifically with the base sequence of at least one
 CC specific HLA-A, -B or -C allele. The method is applicable in gene typing,
 CC judging donor-recipient compatibility during organ transplant and
 CC correlation analysis for diagnosis of various diseases. The method is
 CC simple, rapid and accurate, with possibility of mechanisation and
 CC automation, without the problems encountered by using the prior-art
 CC techniques. AAA66943 to AAA67072 represent oligonucleotide probes and PCR
 CC primers for use in the method of the present invention

 PS
 CC The present invention provides sequences of antisense oligonucleotides
 CC targeted at the murine and human B7-1 and B7-2 coding and mRNA sequences.

CC The antisense sequences have phosphorothioate backbones and some
 CC nucleotides are 2'-methoxyethoxy residues. The sequences can be used in
 CC the treatment of inflammatory and autoimmune disorders, including asthma,
 CC juvenile diabetes mellitus, myasthenia gravis, Graves' disease,
 CC rheumatoid arthritis, allograft rejection, inflammatory bowel disease,
 CC multiple sclerosis, psoriasis, systemic lupus erythematosus, contact
 CC dermatitis, rhinitis, allergies and cancer

PT Antisense oligonucleotide structure and use using fade-inhibition factor
PT API4 as target.
XX
PS Claim 1; Page 1 (Claims); 9pp; Chinese.
XX
CC ABZ21947 to ABZ21958 represents death inhibiting factor tumour related
CC gene (API4, also known as fade-inhibition factor) antisense
CC oligonucleotides. The present invention also describe a human liver
CC cancer (HepG2) cell strain and Balb/c (nu/nu) nude mouse inoculative
CC liver cancer cells which can be used as models for screening and
CC evaluation of the 12 antisense oligonucleotides. In vitro studies show
CC that the antisense oligonucleotides can effectively inhibit the growth of
CC human liver cancer cells, and have a dose-dependent relationship. In the
CC noduliferous nude mouse model the antisense oligonucleotide also inhibits
CC growth of tumours. Therefore, the antisense oligonucleotide can be used
CC in medications for treating tumours and its tumour related diseases

PT Antisense oligonucleotide which specifically hybridizes with a region of
PT a nucleic acid encoding human Damage-specific DNA binding protein p48,
PT useful for treating diseases and conditions associated with p48

PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 13028; 872pp; English.
XX
XX The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

XX Highly carcinogen-sensitive transgenic rats with partial deletion of
PT connexin gene to inhibit normal function of gap junction, applicable in
PT detecting carcinogens and screening anticancer drugs.

XX Example 2; Page 7; 31pp; Japanese.

XX The present invention describes a rat highly sensitive to carcinogen with
CC its normal function of gap junction inhibited. Also described: (1)
CC constructing the transgenic rats by obtaining a plasmid vector through
CC integration of a mutated rat connexin cDNA to the downstream of a
CC promoter, followed by microinjection of such plasmid vector into a
CC fertilised egg and transplantation to the oviduct; (2) detecting
CC carcinogens by administering a test substance into the rat; and (3)
CC screening anticancer substances by administering a test substance into
CC the rat that is highly sensitive to carcinogen to induce cancer onset.
CC The rats are applicable in detecting carcinogens and screening anticancer
CC drugs. With this method, carcinogens can be detected quickly and highly
CC sensitively. These animals can be used for efficient screening of
CC anticancer drugs. The present sequence represents a mutagenic PCR primer
CC for rat gap junction membrane channel protein beta 1 (Gjb1), which is
CC used in an example from the present invention. Rat Gjb1 is located on

 PT New nucleic acid segments of the human genome, particularly from genes
 PT including polymorphic sites, for phenotype correlation, forensics,
 PT paternity testing, medicine and genetic analysis.
 XX
 PS Claim 1; Page 74; 80pp; English.
 XX
 CC DNA sequences AAH62100 - AAH62688 represent segments of human genes which
 CC contain single nucleotide polymorphisms (SNPs). A method is included in
 CC the invention for analysing a nucleic acid sample, which consists of
 CC determining the base occupying any one of the polymorphic sites given in
 CC the SNP containing sequences. The nucleotide sequences can be used in the
 CC diagnosis or monitoring of diseases, such as cancer, inflammation, heart
 CC diseases, diseases of the cardiovascular system, and infection by
 CC microorganisms. The oligonucleotides are also useful in the manufacture
 CC of a medicament for the treatment or prophylaxis of the diseases, and as
 CC a pharmaceutical. SNP containing oligonucleotides are useful in

CC applications such as phenotype correlation, forensics, paternity testing,
 CC medicine and genetic analysis

XX Highly carcinogen-sensitive transgenic rats with partial deletion of
 PT connexin gene to inhibit normal function of gap junction, applicable in
 PT detecting carcinogens and screening anticancer drugs.

XX Example 1; Fig 1; 31pp; Japanese.

XX The present invention describes a rat highly sensitive to carcinogen with
 CC its normal function of gap junction inhibited. Also described: (1)
 CC constructing the transgenic rats by obtaining a plasmid vector through
 CC integration of a mutated rat connexin cDNA to the downstream of a
 CC promoter, followed by microinjection of such plasmid vector into a
 CC fertilised egg and transplacental to the oviduct; (2) detecting
 CC carcinogens by administering a test substance into the rat; and (3)
 CC screening anticancer substances by administering a test substance into
 CC the rat that is highly sensitive to carcinogen to induce cancer onset.
 CC The rats are applicable in detecting carcinogens and screening anticancer
 CC drugs. With this method, carcinogens can be detected quickly and highly
 CC sensitively. These animals can be used for efficient screening of
 CC anticancer drugs. The present sequence represents an oligonucleotide
 CC which is used in an example from the present invention

XX Transforming intact plant tissue by germinating an intact plant seedling
 PT having a shoot apex and directly inoculating the shoot apex of the
 PT germinated intact plant seedling with Agrobacterium tumefaciens to
 PT transform the seedling.

XX Example; Page 8; 23pp; English.

XX The present sequence is a forward PCR primer for the uidA (GUS) gene. Use
 CC with the reverse primer given in ACC84121 amplifies a 1.27 kb fragment
 CC within the uidA gene coding region. The invention discloses a method of
 CC transforming intact plants, allowing translocation e.g. of elite
 CC germplasm. Seedlings are directly inoculated with a virulent strain of
 CC Agrobacterium tumefaciens, subjected to selection, and then generated
 CC directly into plants. The process is genotype-independent and rapid,
 CC since tissues do not pass through a dedifferentiation step to callus, and
 CC plant regeneration is not dependent on shoot organogenesis or somatic
 CC embryogenesis. Somaclonal variation is reduced. The method can be used
 CC with a gymnosperm (conifer, especially pine), or an angiosperm (monocot
 CC or dicot). Transformation of pine (Pinus taeda L.) was used as an example
 CC of the method. An A. tumefaciens strain harbouring super-virulent
 CC pTiBo542 was used to inoculate intact germinated pine seedlings. PCR was
 CC used to screen for Agrobacterium contamination and for transferred genes,
 CC such as uidA, in the regenerated plants

XX

PT New peptide nucleic acid oligomers hybridising to adhesion molecule genes

PT - are stable anti:sense cpds. of high affinity, partic. for treating

PT inflammation, viral infection, cancer etc.

PS

XX Claim 18; Page 45; 57pp; English.

XX

CC New oligomers are claimed which (A) have at least one peptide nucleic

CC acid (PNA) subunit and (B) have a sequence hybridisable to AUG region,

CC coding region, 5'-untranslated region or 3'-untranslated region of ICAM-1

CC or ELAM-1, or hybridisable to AUG region, coding region, 5'- untranslated

CC region, exon/intron junction region or 3'-untranslated region of VCAM-1.

CC The PNAs can be used to target RNA and single stranded DNA (ssDNA) to

CC produce antisense-type gene regulation moieties. Hence they may be used

CC therapeutically for modulating cellular adhesion and thus as

CC antimetastatic agents, anticancer agents, antithinoviral agents, anti-

CC AIDS agents and antiinflammatory agents. They may also be useful as

CC diagnostics, e.g. as probes for specific mRNAs. PNA oligomers have high

CC affinity for complementary single stranded DNA. They are also able to

CC form triple helices in which a first PNA strand binds with RNA or ssDNA

CC and a second PNA strand binds with the resulting double helix or with the

CC first PNA strand. The PNAs possess no significant charge and are water

CC soluble, which facilitates cellular uptake. Further, since they contain

CC amides of non-biological amino acids, they are biostable and resistant to

CC enzymatic degradation by proteases. The present sequence targets vascular

CC cell adhesion molecule-1 (VCAM-1) coding region

PT Testing for disease-associated p53 gene mutation(s) using a hierarchy of

PT assay techniques - e.g. immunoassay, DNA amplification and DNA

PT sequencing.

XX

PS Claim 20; Page 22; 44pp; English.

XX

CC Rapid and cost effective diagnosis of disease-associated mutations in the

CC p53 gene is achieved by employing a selected number of diagnostic tools,

CC in a hierarchy of increasing accuracy and cost per tool, in which each

CC tool detects essentially no false positives. Tests that may be employed,

CC in order of increasing accuracy and cost are: (a) immunoassays; (b) DNA

CC fragment length/quantitv analysis; and (c) DNA sequencing of regions

CC most likely to harbour point mutations. AAT08645-66 are primers used in

CC DNA fragment length/quantity analysis. The amplification of the eleven

CC exons is advantageously carried out in 3 multiplex pools, the members of

CC a pool selected because they all use the same hybridisation temperature

CC and none of the expected fragment lengths will overlap in an

CC electrophoresis gel. One of each pair of primers is labeled at the 5' end

CC with an identifiable marker such as fluorescein, rhodamine or cyanine.

CC The present sequence is used with AAT08662 to amplify a 261 bp fragment

CC of exon 2

XX	
PS	Claim 1; Col 43; 64pp; English.
XX	
CC	The present sequence is one of a number of antisense compounds of up to
CC	30 nucleobases in length that are capable of inhibiting the expression of
CC	phosphoenol pyruvate carboxykinase-cytosolic (PEPCK-cytosolic). The
CC	antisense compounds are useful for inhibiting the expression of PEPCK-
CC	cytosolic in cells or tissues. They are commonly used as research
CC	reagents and in diagnostics, e.g. to elucidate the function of particular
CC	genes. They are also useful for distinguishing between functions of
CC	various members of a biological pathway and for research use. The
CC	antisense compounds are also useful prophylactically, e.g. to prevent or
CC	delay infection, inflammation or tumour formation. The present sequence
CC	is a chimeric phosphorothioate oligonucleotide with 2'-MOE wings and a
CC	deoxy gap

 DR Designing capture oligonucleotide probes for use on a support to which
 XX complementary oligonucleotides hybridize with little mismatch.
 XX Example 5; Fig 29; 300pp; English.

XX The present invention describes a method (M1) for designing capture
 CC oligonucleotide probes (I) for use on a support to which complementary
 CC oligonucleotide probes (II) will hybridize with little mismatch, where
 CC (i) have melting temperatures within a narrow range. The method is useful
 CC for detecting infectious diseases caused by bacterial infectious agents
 CC e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal
 CC infectious agents e.g. Cryptococcus neoformans, Candida albicans and
 CC Aspergillus fumigatus, viruses e.g. T-cell lymphocytotropic virus,
 CC Epstein-Barr virus and polio virus, and parasitic infectious agents
 CC selected from Onchocerca volvulus, Entamoeba histolytica and Dracunculus
 CC medinensis. The method is also useful for detecting genetic diseases such
 CC as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
 CC Detecting cancer involving oncogenes, tumour suppressor genes, or genes
 CC involved in DNA amplification, replication, recombination or repair, the
 CC cancer is specifically associated with a gene selected from BRCA1 gene,
 CC p53 gene, human papillomavirus types 16 and 18 and liver cancers. The
 CC method is also used for environmental monitoring, forensics and the food
 CC and feed industry, detecting comprises scanning (using e.g. a scanning
 CC electron microscope and infrared microscope) the support at the
 CC particular sites and identifying if ligation of the oligonucleotide probe
 CC sets occurred and correlating (using a computer) identified ligation to a
 CC presence or absence of the target nucleotide sequences. ABI82074 to
 CC ABI97546 represent oligonucleotide sequences used in the exemplification
 CC of the present invention

 DR
 XX Screening for modulator of G protein coupled receptor, GPR86 activity, by
 PT incubating cells expressing GPR86 with candidate modulator and detecting
 PT signaling activity of the polypeptide.
 XX
 XX Example 2; Page 62; 103pp; English.
 PS
 XX The present invention relates to a method (M1) for screening for a
 CC modulator of G protein coupled receptor GPR86 (P2Y13) activity. The
 CC method is useful for screening a modulator of GPR86 activity, and for
 CC determining if a candidate modulator increases or decreases the activity
 CC of GPR86. Identified modulators are useful in the manufacture of a
 CC pharmaceutical composition for preventing, treating and/or alleviating
 CC diseases or disorders characterised by dysregulation of GPR86 signalling
 CC such as ostatic hypertrophy, migraine, vomiting, psychotic and
 CC neurological disorders, including anxiety, depression, schizophrenia,
 CC manic depression, delirium, dementia, severe mental retardation,
 CC degenerative diseases, neurodegenerative diseases such as Alzheimer's
 CC disease or Parkinson's disease, dyskinesias such as Huntington's disease
 CC or Gilles de la Tourette's syndrome and other related diseases including
 CC thrombosis and other cardiovascular disease, autoimmune and inflammatory
 CC diseases, inflammatory diseases, fertility dysfunctions, foetal
 CC developmental disorders, infections such as bacterial, fungal, protozoan
 CC and viral infections such as infections caused by HIV-1 and HIV-2, pain,
 CC cancer, anorexia, bulimia, asthma, acute heart failure, hyperension,
 CC urinary retention, osteoporosis, angina pectoris, myocardial infarction,
 CC ulcers, allergies, benign prostatic hypertrophy and stroke. The present
 CC sequence is a PCR primer for human GPR86 (P2Y13; ACC00303), used to
 CC illustrate the invention. The gene for the GPR86 (P2Y13) sequence is
 CC located on chromosome 3q24

XX
XX New compound that hybridizes with and inhibits the expression of
XX Phospholipase A2, group IIA, useful for preparing a composition for
XX treating or preventing inflammation, cancer, psoriasis or diabetes.
XX
XX Claim 3; Page 86; 135pp; English.
XX
XX The present invention describes a compound (I) comprising 8-50
XX nucleobases which is targeted to a 5' untranslated region (UTR), coding,
XX 3' UTR or intron region of a nucleic acid molecule encoding phospholipase
XX A2, group IIA (synovial), where the compound specifically hybridises with
XX and inhibits the expression of phospholipase A2, group IIA (synovial).
XX Also described: (1) a composition comprising the compound and a carrier
XX or diluent; (2) a method of inhibiting the expression of phospholipase
XX A2, group IIA in cells or tissues; and (3) a method of treating an animal
XX having a disease or condition associated with phospholipase A2, group IIA
XX (synovial). (I) has antiinflammatory, antidiabetic, cytostatic and
XX antipsoriatic activities, and can be used in vaccines and in gene
XX therapy. The compound (I) can be used for preparing a composition for
XX treating or preventing inflammation, cancer, psoriasis or diabetes. The
XX present sequence represents a human phospholipase A2 group IIA (synovial)
XX chimeric phosphorothioate antisense oligonucleotide, which is used in an
XX example from the present invention

 PS
 XX The invention is directed to the identification and isolation of novel
 CC genes that encode enzymes involved in the synthesis of polyunsaturated

CC fatty acids (PUFAs). In particular the invention is directed to genes
 CC derived from the fungus Saprolegina diclina that encode omega-3
 CC desaturase (also referred to as delta-17 desaturase) and delta-12
 CC desaturase. Polynucleotides, composition and methods of the invention are
 CC useful for preventing or treating conditions caused by insufficient
 CC intake of at least one PUFA e.g. eczema, burned or dry skin, acquired
 CC immune deficiency syndrome (AIDS), multiple sclerosis or inflammatory
 CC skin disorders. Products produced in the method of the invention are
 CC useful in pharmaceutical and nutritional compositions, animal feeds and
 CC cosmetics. The invention is also useful in gene therapy. The present
 CC sequence is a PCR primer used to isolate omega-3 desaturase gene from
 CC Saprolegina diclina

 PS
 XX The invention relates to a method of inhibiting corneal allograft
 CC rejection, by contacting the allograft with a topical formulation
 CC comprising an antisense oligonucleotide targeted to intercellular
 CC adhesion molecule-1 (ICAM-1), extracellular adhesion molecule-1 (ELAM-1)
 CC or vascular cell adhesion molecule-1 (VCAM-1). The oligonucleotide is
 CC useful for inhibiting corneal allograft rejection or for preserving a
 CC corneal explant ex vivo, where the explant is human. This sequence
 CC corresponds to one of the oligonucleotide of the invention.

XX XX
XX CC A method has been developed for detecting the presence or absence of a
XX CC single nucleotide polymorphism (SNP) allele in a genomic sample. The
XX CC method comprises preparing a reduced complexity genome (RCG) from the
XX CC genomic sample and analysing the RCG for the presence or absence of a SNP
XX CC allele. The method can be used to characterise a tumour, to generate a
XX CC genomic pattern for an individual genome or to generate a genomic
XX CC classification code for a genome. The method can be used to assess
XX CC whether a subject is at risk for developing a disease or to identify a
XX CC set of SNP alleles associated with a disease. The method can also be used
XX CC to perform linkage analysis. AAA35944 to AAA35947 represent sequences

 PS Disclosure; Page 512; 771pp; French.
 XX
 CC The invention relates to the isolation of 6327 nucleotide sequences,
 CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
 CC sequence having at least 80% identity, after optimal alignment, with the
 CC nucleotides, a sequence that hybridizes under stringent conditions with
 CC the nucleotides, or the complement, or corresponding RNA, of the
 CC nucleotides. The nucleotides are used as probes or primers for detecting,
 CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
 CC sense and antisense sequences, of nucleotides involved in tumour
 CC suppression or reversion, apoptosis and or viral resistance, to produce
 CC recombinant polypeptides, and to prepare transgenic animals, as
 CC experimental models. The nucleotides (also vectors containing them and
 CC cells containing the vectors), the encoded polypeptides and antibodies
 CC (Ab) against the polypeptide are useful for prevention and/or treatment
 CC of viral infections or diseases characterized by development of tumours
 CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
 CC Analysis of the expression of the nucleotides can be used for diagnosis
 CC and/or prognosis of these diseases. The nucleotides and polypeptides can
 CC also be used to screen for their specific interactive molecules,
 CC potentially useful for treating diseases associated with abnormal
 CC expression of the nucleotides.

 XX Testing for disease-associated p53 gene mutation(s) using a hierarchy of
 PT assay techniques - e.g. immunoassay, DNA amplification and DNA
 PT sequencing.

XX Claim 11; Page 26; 4app; English.

PS Rapid and cost effective diagnosis of disease-associated mutations in the

XX p53 gene is achieved by employing a selected number of diagnostic tools,

CC in a hierarchy of increasing accuracy and cost per tool, in which each

CC tool detects essentially no false positives. Tests that may be employed,

CC in order of increasing accuracy and cost are: (a) immunoassays; (b) DNA

CC fragment length/quantitatively analysis; and (c) DNA sequencing of regions

CC most likely to harbour point mutations. AAT08667-85 are primers used in

CC DNA sequencing analysis. The primers are generally nested inside the

CC amplification primers (AAT08645-66), i.e. closer to the exon, although in

CC some cases the preferred sequencing primer is in fact the amplification

CC primer. The sequencing primer is conjugated to a fluorescent mol. such as

CC fluorescein, rhodamine or cyanine. The present sequence is used to

CC sequence the antisense strand of exon 5

XX

XX New Caenorhabditis elegans clk-1 gene - used to obtain human clk-1

PT sequence, useful for, e.g. cancer diagnosis.

PT

PS Disclosure; Page 15; 46pp; English.

XX

XX Primer SHP57 (AAV30208) was used with primer SHP58 (AAV30209) and primer

CC SHP59 in a nested PCR reaction to amplify the Caenorhabditis elegans clk-

CC 1 cDNA. The invention provides the C. elegans clk-1 protein (AAW56670)

CC which is involved in the developmental rate and longevity at the cellular

CC physiology level, where clk-1 mutants have a longer life and altered

CC cellular metabolism relative to wild-type. The clk-1 gene may be cloned

CC to identify related genes, for e.g. the human clk-1 sequence can be

CC identified and may be useful in the diagnosis and/or prognosis of cancer.

CC The invention claims that downregulation of expression of clk-1 can be

CC used to increase the life span of animals or humans. The invention also

CC claims that if downregulation clk-1 expression could be targeted to a

CC particular tissue or organ, it could lead to a specific physiological

CC slowing down of this tissue/organ and a concomitant slower rate of

CC degradation by the ageing process. Alternatively, administration of an

CC agent to promote tissue- or organ-specific overexpression of clk-1 could

CC allow the physiological rates of tissues or organs to be increased, to

CC treat pathological conditions causing a slowdown of physiological rate of

CC tissues/organs in a patient

XX

XX Antisense oligonucleotides targeted to nucleic acids encoding human tumor

PT necrosis factor receptor-associated factor (TRAF), useful for treating

PT diseases associated with TRAF expression such as inflammatory diseases.

XX

PS Example 17; Page 56; 170pp; English.

XX

XX The present invention relates to antisense oligonucleotides (see AAA55495

CC -A55757) which are targeted to nucleic acids encoding a human tumour

CC necrosis factor receptor-associated factor (TRAF). The antisense

CC sequences comprise at least one modified internucleotide linkage, which

CC is a phosphorothioate linkage. The oligonucleotides also include at least

CC one modified sugar moiety such as a 2'-O-methoxyethyl sugar moiety.

CC Sequences AAA55490-A55495 represent nucleotide sequences encoding human

CC TRAF1-6. Included in the invention is a method for treating a human

CC having a disease associated with the expression of TRAF comprising

CC administering an antisense oligonucleotide. The reduction of jun kinase

CC activation in cells comprises contacting the cells with an antisense

CC oligonucleotide targeted to TRAF-6. A method for the reduction of E-

CC selectin expression in cells or tissues comprises contacting the cells or

CC tissues with an antisense oligonucleotide targeted to TRAF-2 or TRAF-6.

CC The antisense oligonucleotides have antiproliferative and anti-

CC inflammatory activity and are useful for treating disorders associated

CC with cell proliferation and inflammation. The antisense oligonucleotides
 CC may also be used as a diagnostic probe for studying gene function

XX PT Transcription factor regulating the expression of ethylene-inducible
 PT genes and gene encoding it, useful for imparting resistance to
 PT environmental stress to plants.

XX PS Example 3; Fig 5; 65pp; Japanese.

XX CC The present invention describes a transcription factor regulating the
 CC expression of ethylene-inducible genes in plants, having DNA binding
 CC activity specific to the consensus sequence A(T/C)G(A/T)A(C/T)CT. The
 CC present invention describes the tobacco ethylene insensitive 3 (EIN3)-
 CC like protein, designated TEIL, isolated from Nicotiana tabacum cv Samsun
 CC NN. The transcription factor is used to impart environmental stress
 CC resistance to plants by transformation with the gene for the
 CC transcription factor; and screening potential inhibitors of the
 CC expression of ethylene-inducible genes in plants. AAZ95383 to AAZ95476
 CC represent oligonucleotides used in the exemplification of the present
 CC invention

XX PT New transgenic non-human animal expressing a foreign polypeptide
 PT associated with drug behavior and/or metabolism, useful for studying the
 PT behavior and/or metabolism of a drug in other animals.

XX PS Example 2A; Page 54; 408pp; English.

XX CC This invention relates to a transgenic non-human animal which may be used
 CC for assessing the behaviour and/or metabolism of a drug in another animal
 CC and which expresses a foreign polypeptide associated with drug behaviour
 CC and/or metabolism. The invention also comprises a nucleic acid construct
 CC for use in producing the above transgenic non-human animal and a method
 CC of assessing the metabolism and/or behavior of a drug in an animal of
 CC interest, comprising administering a test agent to the transgenic animal
 CC and conducting analytical tests to determine drug metabolism and/or
 CC behaviour. The transgenic animal is useful in studying drug metabolism
 CC and/or behaviour in other animals. The nucleic acid construct is useful
 CC in producing the above transgenic animal and the methods are used for
 CC producing, breeding and using transgenic animals for pharmacological
 CC (e.g. pharmacokinetic or pharmacodynamic assays) and/or toxicological
 CC studies. Nucleic acid sequences used within the invention are serum
 CC albumin; alpha-acidic glycoprotein; cytochrome P450 (CYP); uridine
 CC diphosphoglucuronosyl transferase (UGT); multidrug resistance proteins
 CC and (MRP's). The present sequence represents a PCR primer used to create
 CC a transgenic animal within the scope of the invention

 XX
 XX Claim 4; Page 33; 528pp; Japanese.
 XX
 XX The present invention describes a method of arraying genome clones. The
 CC method comprises: (a) clones of the genomic libraries contained in
 CC multiwell plates numbered for discrimination are mixed in each of the
 CC multiwell plates; (b) a primer designed based on the chromosome marker
 CC sequence is added to the mixture to carry out an amplification reaction;
 CC (c) a signal corresponding to the marker is detected from the resultant
 CC amplified product to specify the discrimination Nos. of the multiwell
 CC plates containing the clones having said marker sequence; (d) the order
 CC of the markers is changed so that the same discrimination Nos. succeed to
 CC the maximum in the specified discrimination Nos. to array the multiwell
 CC plates; (e) the clones in the multiwell plates of the specified
 CC discrimination Nos. are mixed respectively in each wells of longitudinal
 CC and lateral directions; (f) the mixed clones are cultured and the
 CC resultant cultures are amplified by using the above primer; (g) signals
 CC are detected from the amplified products; (h) the clones in the multiwell
 CC plates are specified from the detected result; and (i) the clones are
 CC reconstituted as the positions on the chromosome and arrayed. The
 CC microarray is useful for gene analysis. ABL42957 to ABL45322 represent
 CC PCR primers for human chromosome lp36-35 DNA, and ABL45323 to ABL45634
 CC represent PCR primers for human chromosome 21q22.1, which are
 CC specifically claimed for use in the present invention

 XX
 XX Novel antisense compound, specifically hybridizing to and inhibiting the
 PT expression of Inhibitor of DNA binding-1, useful for treating
 PT hyperproliferative, immune, muscular, vascular or pancreatic disorder.
 XX
 XX Example 15; Page 82; 105pp; English.
 XX
 XX The invention relates to novel antisense compounds (I) 8-30 nucleobases
 CC in length targeted to a nucleic acid molecule encoding Inhibitor of DNA
 CC binding-1, where (I) specifically hybridises with and inhibits the
 CC expression of Inhibitor of DNA binding-1. Antisense inhibition of human
 CC Inhibitor of DNA binding-1 expression by chimeric phosphorothioate
 CC oligonucleotides having 2'-methoxyethyl (2'-MOE) wings and a deoxy gap
 CC was tested. A series of oligonucleotides were designed to target
 CC different regions of the human Inhibitor of DNA binding-1 RNA. The
 CC compounds were analysed for their effect on human Inhibitor of DNA
 CC binding-1 mRNA levels by quantitative real-time polymerase chain reaction
 CC (PCR). The result showed that the oligonucleotides showed at least 25%
 CC inhibition of human Inhibitor of DNA binding-1 expression. (I) is useful
 CC for inhibiting the expression of Inhibitor of DNA binding-1 in cells or
 CC tissues by contacting the cells or tissues with (I). (I) is also useful
 CC for treating a human having a disease or condition associated with
 CC Inhibitor of DNA binding-1 by administering a therapeutically or
 CC prophylactically effective amount of (I), where the disease or condition
 CC is a hyperproliferative disorder, immune disorder, muscular disorder,
 CC vascular disorder or pancreatic disorder. (I) may also be used for
 CC diagnostics, therapeutics, prophylaxis (e.g., to prevent or delay
 CC infection, inflammation or tumour formation), and as research reagents
 CC and kits. (I) may be safely and effectively administered to humans. The
 CC present sequence represents a human Inhibitor of DNA binding-1, antisense
 CC oligonucleotide used in the method of the invention

PT topically applying an antisense compound targeted to the nucleic acid
PT encoding human B7 protein.
XX
XX Example 12; SEQ ID NO 126; 88pp; English.
PS
XX The invention relates to a method of treating an inflammatory skin
CC disorder in an individual by topically applying an antisense compound
CC targeted to a nucleic acid molecule encoding a human B7 protein. The
CC invention is for treating an inflammatory skin disorder in individual.
CC The skin disorder is psoriasis, contact dermatitis, atopic dermatitis,
CC seborrheic dermatitis, nummular dermatitis, generalised exfoliative
CC dermatitis or eczema. The invention effectively modulates critical
CC costimulatory molecules such as the B7 protein. The present sequence
CC represents a human B7-1 targeted oligonucleotide.

XX New compound, preferably an antisense oligonucleotide, that hybridizes
 PT and inhibits the expression of phosphoinositide phosphatase (PTEN), for
 PT treating diseases such as diabetes, or a hyperproliferative condition.
 XX Claim 7; Page 34; 39pp; English.
 XX The invention relates to antisense compounds, compositions and methods
 CC for modulating the expression of phosphoinositide phosphatase (PTEN). The
 CC antisense compound is used to inhibit the expression of PTEN in cells or
 CC tissues, preferably human, or rodent, such as mouse or rat, liver, kidney
 CC or adipose cells or tissues. It is used to treat a disease or condition
 CC associated with PTEN, such as a metabolic disease or condition,
 CC preferably diabetes, especially Type 2 diabetes, or a hyperproliferative

CC condition. It is also used to decrease blood glucose or insulin levels in
CC an animal, preferably a diabetic human or rodent. It is also used to
CC inhibit expression of PECK in cells or tissues. It is also used to
CC decrease insulin resistance, or increase insulin sensitivity, in an
CC animal, preferably a diabetic human or rodent. It is used to decrease
CC blood triglyceride or cholesterol levels in an animal, preferably a
CC diabetic human or rodent. It is also used in antisense gene therapy. The
CC present sequence is an antisense oligonucleotide targetted to human PTEN
CC DNA

XX Amplifying nucleic acid by synthesizing template nucleic acid containing
PT a predetermined sequence and hairpin structure and using the template for
PT target amplification by Single Primer Amplification.

XX Example 6; Page 35; 54pp; English.

XX The invention relates to a method for amplifying a nucleic acid using
CC Single Primer Amplification (SPA). The method comprises synthesising a
CC template nucleic acid containing a predetermined sequence and hairpin
CC structure with the nested oligonucleotide extension reaction. The method
CC is useful for amplifying a nucleic acid, preferably for amplifying a
CC family of related nucleic acid sequences to build a complex library of
CC polypeptides encoded by the sequences. The engineered nucleic acid strand
CC is useful for amplifying a nucleic acid strand by providing a nucleic
CC acid with a predetermined sequence engineered onto its first end, a
CC sequence complementary to the predetermined sequence and a hairpin
CC structure between them and contacting the engineered nucleic acid strand
CC with a primer containing at least a portion of the predetermined
CC sequence. This process is done in the presence of a polymerase and
CC nucleotides under conditions suitable for polymerisation to produce a
CC complementary nucleic acid strand. The method of the invention is useful
CC for producing large amounts of a target nucleic acid sequence and for

CC amplifying simultaneously more than one different target nucleic acid
CC sequence located on the same or different nucleic acid molecules. This
CC polynucleotide sequence represents an oligonucleotide relating to the
CC invention

 XX Testing for disease-associated p53 gene mutation(s) using a hierarchy of
 PT assay techniques - e.g. immunoassay, DNA amplification and DNA
 PT sequencing.
 XX
 XX Claim 11; Page 26; 44pp; English.
 PS
 XX Rapid and cost effective diagnosis of disease-associated mutations in the
 CC p53 gene is achieved by employing a selected number of diagnostic tools,
 CC in a hierarchy of increasing accuracy and cost per tool, in which each
 CC tool detects essentially no false positives. Tests that may be employed,
 CC in order of increasing accuracy and cost are: (a) immunoassays; (b) DNA
 CC fragment length/quantitatively analysis; and (c) DNA sequencing of regions
 CC most likely to harbour point mutations. AAT08667-85 are primers used in
 CC DNA sequencing analysis. The primers are generally nested inside the
 CC amplification primers (AAT08645-66), i.e. closer to the exon, although in
 CC some cases the preferred sequencing primer is in fact the amplification
 CC primer. The sequencing primer is conjugated to a fluorescent mol. such as
 CC fluorescein, rhodamine or cyanine. The present sequence is used to
 CC sequence the sense strand of exon 2, and is a preferred sequencing primer
 CC for this exon

XX PT Analysing nucleic acid containing sample - comprises performing multiplex amplification reaction and reacting amplified fragments in sequencing reaction mixture.

XX PS Example 4; Page 18; 37pp; English.

XX CC This sequence represents a primer for exon 2 of the p53 gene. This sequence can be used in the method of the invention for analysing a nucleic acid containing sample. The method comprises performing a multiplex amplification reaction on the nucleic acids in the sample using amplification primer pairs, one pair for each region to be analysed, to produce a mixture of amplified fragments, and determining the sequence of at least one species of amplified fragment, characterised in that the sequence is determined by combining the mixture of amplification fragments with a sequencing reaction mixture for the production of sequencing fragments, and evaluating the sequencing fragments produced. The method can be used to analyse regions in the nucleic acids in the sample for the presence of mutations, or detect and type microorganisms.

CC The method directly performs sequencing reactions on complex DNA mixtures

XX PT Human homolog of the Drosophila fused gene.

XX PS Example 1; Page 66; 81pp; English.

XX CC PCR primers AAX81944-45 were used to amplify cDNA encoding a human homologue to molecules associated with the Drosophila fused gene. The protein is involved in eliciting an intracellular signal in the human hedgehog-patched (HH-PTC). The protein, its antibodies and pharmaceutical compositions comprising them can be used as medicaments. The presence of a fused gene, cDNA, mRNA, protein or subsequences of these in a biological sample are useful, e.g. as a marker to assess in vivo and/or in situ RNA transcription and/or translation, in cancer diagnostics, in prophylaxis, etc. The polynucleotide sequence can also be used to derive probes for the detection and quantification of normal or abnormal fused gene sequences. The labeled probes can also be useful in karyotyping analysis as markers of the fused gene. The polynucleotides may also be used in gene therapy methods. The polypeptide is useful as a lead compound in the design of analogues and mimics, as well as for screening for agonists and antagonists. The products may also be used for the study of different conditions, such as cancer and development of cancer therapies, the regulation of gene transcription, embryonic repair and tissue repair/wound healing, neurodegenerative diseases, and testicular function

 CC AAV73500-V73506 are oligonucleotide primers used in a method for the
 CC specific inhibition of amplification of a DNA target sequence. This
 CC process is used to identify biological material such as bacteria or
 CC viruses, e.g. to distinguish between ribosomal sequences from different
 CC bacteria that are all primed by the same broad-range primers, especially
 CC to distinguish between Escherichia coli, Staphylococcus aureus and
 CC Neisseria gonorrhoea, to prevent unwanted amplification of contaminating
 CC bacterial DNA sequences, e.g. in Taq DNA polymerase preparations, for
 CC genotyping by blocking amplification of one allele and to eliminate
 CC unwanted sequences in representational difference analysis. Expensive
 CC peptide nucleic acids are not required

 XX
 XX Claim 66; Page 49; 216pp; English.
 PS
 XX
 XX The sequences given in AAT28558-59 represent universal primers which were
 CC used in the method of the invention for the detection of bacterial
 CC species in a sample. These sequences are derived from 16S or 23S
 CC ribosomal RNA gene sequences. The method of the invention comprises using
 CC probes and/or amplification primers which are specific, ubiquitous and
 CC sensitive for determining the presence and/or amount of nucleic acids
 CC from selected bacterial species in any sample, where the bacterial
 CC nucleic acid comprises a selected target region hybridisable with the
 CC probes or primers. The method comprises contacting the sample with the

CC probes or primers and detecting the presence and/or amount of hybridised
 CC primers or amplification products as and indication of the presence
 CC and/or amount of the bacterial species. This method may be used to detect
 CC commonly encountered bacterial pathogens, e.g. *Escherichia coli*,
 CC *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Proteus mirabilis*,
 CC *Streptococcus pneumoniae*, *Staphylococcus aureus*, *Staphylococcus*
 CC *epidermidis*, *Enterococcus faecalis*, *Staphylococcus saprophyticus*,
 CC *Streptococcus pyogenes*, *Haemophilus influenzae* and *Moraxella catarrhalis*.
 CC These bacterial species are associated with approx. 90% of urinary tract
 CC infections and with a high percentage of other severe infections
 CC including septicaemia, meningitis, pneumonia, intra-abdominal infections,
 CC skin infections and other severe respiratory tract infections. The method
 CC may also be used to evaluate a bacterial resistance to beta- lactam
 CC antibiotics

 XX
 XX Detection of Gram-negative bacterial nucleic acid - by amplification and
 XX hybridisation with specified probes, useful for diagnosing Gram-negative
 XX bacterial septicaemia.
 XX
 XX Example 1; Col 19; 23pp; English.
 XX
 XX The present sequence represents primer RW01 for amplifying a target
 XX region of a bacterial nucleic acid. Detecting bacterial nucleic acid
 XX sequences in a sample (e.g. blood sample) suspected of containing such a
 XX bacterial nucleic acid involves the bacterial nucleic acid containing a
 XX selected target region, which is then amplified and the amplified target
 XX region hybridises with a probe. This method can be used for detecting
 XX Gram-negative bacteria in human blood samples. It is particularly useful
 XX for diagnosis of Gram-negative bacterial septicaemia. The method can also
 XX be modified so that it can detect other bacteria present in blood, or

CC other samples. The method provides for the rapid detection and
 CC identification of bacteria, partly because it is not necessary to culture
 CC the bacteria first. It also provides less opportunities for a mistake to
 CC occur than in the current Gram-staining methods. (Updated on 25-MAR-2003
 CC to correct PF field.)

 XX in conjunction with treatment for diabetes, high blood pressure and high
 XX cholesterol.
 XX
 XX Claim 32; Page 118; 171pp; English.
 XX
 XX The present sequence represents a specifically claimed primer used in the
 XX present invention describing a leptin receptor (OB-R) protein. The OB-R
 XX can be used to treat obesity, optionally in conjunction with a treatment
 XX for diabetes, high blood pressure and high cholesterol, or in cosmetic
 XX compositions for reducing body weight. It may also be used in agriculture
 XX to produce leaner food animals, e.g. beef cattle, swine poultry, sheep.
 XX An antibody specific for OB-R can be used to measure the presence of OB-R
 XX in a sample, optionally in vivo, while the nucleic acid molecule encoding
 XX OB-R can be used to detect defects in the OB-R polypeptide associated
 XX with obese phenotypes, or diagnostically to measure its encoded RNA and
 XX protein in nutritional disorders. The nucleic acid molecule can be used
 XX in gene therapy, or the antisense nucleic acid molecule can be used to
 XX antagonise leptin activity. The nucleic acid molecule, or the antisense
 XX nucleic acid molecule, can be used to treat weight loss e.g. associated
 XX with AIDS, cancer or anorexia nervosa

PS	Disclosure; Page 33; 71pp; English.
XX	
CC	AAV20965-V20991 are PCR primers used in the construction of a novel
CC	fusion protein constructed from a papillary renal cell carcinoma (PRCC)
CC	associated protein and the transcription factor TFE3 which is used in a
CC	method for the diagnosis, prophylactic and therapeutic treatment of
CC	papillary renal cell carcinoma. The translocation t(X;1) (p11.2;q21.2)
CC	found in PRCC results in a fusion of the TFE3 gene with a new chromosome
CC	1 gene designated PRCC (at 1q21.2), resulting in expression of a fusion
CC	protein between the N-terminus of PRCC and almost the whole of the TFE3
CC	gene. Normal TFE3 transcripts are no longer produced. Two other fusion
CC	partners for TFE3 have also been detected; NoNo, from a invx (p11.2;q13-
CC	24 or 12) translocation and the PSF splice factor gene, resulting in t(X;
CC	1) (p11.2;p34). These trans-locations define a subgroup of PRCC generally
CC	encountered in patients younger than 25

PT Pluripotent cells containing foreign chromosomes or fragments - and non-
PT human chimeric animals constructed using them and expressing foreign
PT genes such as human antibiotic genes.
XX
PS Example 5; Page 40; 217pp; Japanese.
XX
CC The present invention describes a method of obtaining pluripotent cells
CC containing foreign chromosomes or their fragments (preferably at least
CC 670 kb in length, especially more than 1000 kb) by preparing cancerous
CC cells containing the foreign chromosomes or fragments, then fusing these
CC with pluripotent cells such as embryonic stem cells, embryonic
CC reproductive cells, embryonic cancer cells or their mutants. Also
CC described are: (1) a method of obtaining hybridoma cells by fusing a cell
CC with a high ability to produce hybridoma cells (such as mouse A9 cells)
CC with a cell containing the foreign chromosomes or fragments (such as
CC normal human diploid cells); (2) a method of utilising pluripotent cells
CC to produce chimeric and transgenic non-human animals (especially mammals
CC such as mice) which can express the foreign chromosomes or fragments
CC introduced; and (3) chimeric animals, their offspring and tissues and
CC cells derived from the offspring produced by a method as in (2). The
CC inventions can be used for the production of monoclonal antibodies for
CC medical use which are of human type and therefore not antigenic in
CC transgenic animals which express useful foreign proteins, or which can
CC serve as models for the study of human diseases. AAV52755 to AAV52828 are
CC PCR primers used in examples from the present invention

XX New anti alpha_v beta_3 vitronectin receptor antibodies - used for

```

PT immunotherapeutic treatment of e.g. diabetic retinopathy, inflammatory
 PT disorders, atherosclerosis, restenosis, cancers or osteoporosis.
 XX
 PS Example 13; Page 46; 97pp; English.

XX Primer SBA884 and SBA843 (see AAV71814) were used in the PCR
 CC amplification of a synthetic gene (see AAV71801) encoding a portion of
 CC the murine D12 monoclonal antibody heavy chain variable region (VH) that
 CC is modified in humanised D12 VH D12H2HC 1-0. The amplified DNA was
 CC ligated into pCR2000 vector, and a DNA fragment from this vector was
 CC utilised in the construction of an expression vector for humanised D12 VH
 CC (see AAV71799). D12 is a murine anti-human alpha-v beta-3 vitronectin
 CC receptor monoclonal antibody. Humanised D12 antibodies of the invention
 CC can be used for passive immunotherapy of disorders mediated by the alpha-
 CC v beta-3 vitronectin receptor, e.g. restenosis and angiogenic-related
 CC disorders

XX Genome sequence of Chlamydia trachomatis.

XX Disclosure; Page 1620; 1755pp; English.

XX PCR primers AAZ01426-Z06209 were used to amplify open reading frames
 CC (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs
 CC encode polypeptides (see AAV36754-Y37949) which can be used as vaccines
 CC against Chlamydia trachomatis. Antisense and ribozyme sequences can also
 CC be used to control growth of the microorganism. Chlamydia trachomatis is
 CC responsible for a large number of diseases, e.g. eye diseases such as
 CC conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion

CC conjunctivitis; genital diseases such as nongonococcal urethritis,
 CC epididymitis, cervicitis, salpingitis, perinephritis, bartholinitis;
 CC Pneumopathy in breast feeding infants; and venereal lymphogranulomatosis.
 CC The polypeptides of the invention may be of use in treating these
 CC diseases

XX Antisense oligonucleotides against thiorodoxin and thiorodoxin reductase
 PT genes, useful for inhibiting tumor growth and metastasis.

XX Claim 4; Page 21; 88pp; English.

XX This invention describes novel antisense oligonucleotides against
 CC thiorodoxin and thiorodoxin reductase gene which have cytostatic activity
 CC and are useful for inhibiting tumour growth and metastasis in mammals.
 CC They may also be used as hybridization probes to detect the presence of
 CC the thiorodoxin and thiorodoxin reductase mRNAs in mammalian cells. They
 CC may also be used as molecular weight markers. The antisense
 CC oligonucleotides are nuclease resistant due to the presence of
 CC phosphorothioate internucleotide linkages. AAZ00504-Z00543 represent
 CC oligonucleotide primers capable of binding to human thiorodoxin reductase
 CC mRNA

XX PT Distinction of HLA-A allele type - using PCR and electrophoresis.
XX ES Claim 5; Page 7; 21pp; Japanese.
XX CC This sequence represents a PCR primer for a human leukocyte antigen-A
CC (HLA-A) allele, and can be used in the methods of the invention. The
CC method are for the distinction of HLA-A allele type. In the first method
CC a set of primers corresponding to each group specific to the base
CC sequence common to each gene in at least one specific group consisting of
CC specific HLA-A allele group is used to carry out a PCR to amplify
CC selectively the HLA-A allele group in each specific group as a group. In
CC the second method the amplified product obtained by the PCR is developed
CC by electrophoresis and the presence of an amplified DNA band of a
CC specific size is confirmed to distinct a specific type of the HLA-A
CC allele group in each specific group as a group. Further, in the second
CC method, if a specific type of HLA-A allele group is distinguished the
CC following methods are further carried out: RFLP method, PCR-RFLP method,
CC SSOP method, PCR-SSOP method, PCR-SSP method or PCR-SSCP method. The
CC methods can be used for the diagnosis of HLA-A type in humans

 XX
 DR Oligonucleotide for treating diseases associated with human tumor
 XX necrosis factor-alpha (TNF-alpha) such as, diabetes and rheumatoid
 PT arthritis, comprises nucleotide sequence complementary to intron of
 PT nucleic acid encoding TNF-alpha.
 XX
 PS Claim 24; Page 40; 283pp; English.
 XX
 CC This sequence represents an antisense oligonucleotide sequence which
 CC targets a region of the human tumour necrosis factor alpha (TNFalpha)
 CC nucleotide sequence. TNFalpha is an important cytokine that plays a role
 CC in host defence. It is produced mainly in macrophages and monocytes in
 CC response to infection, invasion, injury or inflammation. Overexpression
 CC of TNFalpha can result in disease states, particularly in infectious,
 CC inflammatory and autoimmune diseases. The invention relates to antisense
 CC oligonucleotides, such as that represented by the present sequence which
 CC are capable of modulating the TNFalpha gene expression. The
 CC oligonucleotides optionally have a phosphorothioate backbone, and may
 CC also optionally contain at least one 2'-O-methoxyethyl modification. The
 CC oligonucleotides are useful for modulating the expression of human
 CC TNFalpha in cells and tissues, reducing a human cell inflammatory
 CC response, reducing the blood glucose level in a human and treating a
 CC human having a disease or condition associated with TNFalpha. Examples of
 CC diseases associated with TNFalpha include diabetes, inflammatory bowel
 CC disease, multiple sclerosis, pancreatitis, rheumatoid arthritis,
 CC infectious disease, hepatitis, atopic dermatitis or allograft rejection.
 CC The antisense oligonucleotides are also useful for modulating the
 CC function of a selected nucleic acid sequence in adipose tissue

 PT disorders such as anxiety, obsessive-compulsive disorder, panic
 PT disorders, post-traumatic stress disorder, phobias and depression in a
 PT mammal.
 XX
 XX Claim 8; Page 21; 34pp; English.

XX The present sequence is an antisense oligonucleotide. This sequence is
 CC directed against the mRNA of the Corticotropin Releasing Factor subtype-2
 CC (CRF 2) receptor, and hence substantially reduces CRF 2 receptor
 CC expression in the brain. CRF is known to play an important part in
 CC controlling the pituitary-adenocortical system and in mediating the
 CC behavioural, autonomic and immune responses to stress. The present
 CC sequence can be used to treat psychiatric disorders such as anxiety,
 CC obsessive-compulsive disorder, panic disorders, post-traumatic stress
 CC disorder, phobias and depression. The present sequence can also be used
 CC in screening assays to determine compounds that have activity for the
 CC treatment of the psychiatric disorders

Novel antisense compounds capable of modulating expression of dactx useful
 for diagnosis, prophylaxis and treatment of diseases associated with
 expression of dactx.

Example 15; Col 42; 59pp; English.

The present invention describes an antisense compound (I) up to 30
 nucleobases in length, where (I) inhibits expression of dactx (also known
 as Fas binding protein, CENP-C binding protein, dap6; EAP; cytosstatic and
 protein 6 and EAP for Ets-1 associated protein). (I) has cytosstatic and
 antiinflammatory activity, and can be used in antisense therapy and as a
 modulator of dactx. (I) is useful for inhibiting the expression of dactx in
 cells or tissues in vitro. (I) can be utilised for diagnostics,
 therapeutics for the treatment of diseases associated with the expression
 of dactx, prophylaxis e.g. to prevent or delay infection, inflammation or
 tumour formation and as research reagent. The present sequence represents
 an inhibitory human dactx antisense phosphorothioate oligonucleotide which
 is used in the exemplification of the present invention

 XX

Antisense compound useful for treating hyperproliferative, neurological,
 inflammatory and autoimmune disorders and diabetes inhibits human PARP.

Claim 3; Page 84; 168pp; English.

The invention relates to antisense oligonucleotides targeted to human
 PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly
 (ADP-ribose) polymerase plays an important role in chromatin
 decondensation, DNA replication, DNA repair, gene expression, malignant
 transformation, cellular differentiation and apoptosis. The antisense
 oligonucleotide inhibitors are useful for inhibiting the expression of
 PARP in human cells or tissues. They are also useful for treating a human
 with a disease associated with PARP especially hyperproliferative
 disorders (e.g. cancer), cellular injury resulting from oxidative stress,
 neurological (e.g. parkinsonism, meningitis-associated intracranial
 complications and ischaemia), inflammatory and autoimmune disorders (e.g
 arthritis) and diabetes. The present sequence is an antisense
 oligonucleotide of the invention

 XX XX
 XX XX Isolated genes (Gene 216) from human chromosome 20p13-p12 and the
 XX XX proteins they encode, useful for the prevention, diagnosis and treatment
 XX XX of asthma, obesity and inflammatory bowel disease.
 XX XX
 XX XX Example 10; Page 150; 520pp; English.
 XX XX
 XX XX The invention relates to isolated genes (Gene 216) from human chromosome
 XX XX 20p13-p12 and the proteins they encode. The nucleic acids and proteins
 XX XX may be used in the prevention, diagnosis and treatment of diseases
 XX XX associated with inappropriate gene 216 expression. For example, the
 XX XX nucleic acids (or vectors) and proteins may be used to treat disorders
 XX XX associated with decreased expression by rectifying mutations or deletions
 XX XX in a patient's genome that affect the activity of gene 216 by expressing
 XX XX inactive proteins or to supplement the patients own production of Gene
 XX XX 216 proteins. Additionally, the nucleic acids may be used to produce the
 XX XX secreted Gene 216 protein, by inserting the nucleic acids into a host
 XX XX cell and culturing the cell to express the protein. The nucleic acids and
 XX XX complementary sequences may also be used as DNA probes in diagnostic
 XX XX assays to detect and quantitate the presence of similar nucleic acid
 XX XX sequences in samples and therefore which patients may be in need of
 XX XX restorative therapy. The Gene 216 protein may also be used as antigens in
 XX XX the production of antibodies against Gene 216 and in assays to identify
 XX XX modulators of Gene 216 expression and activity. The anti-Gene 216
 XX XX antibodies and antagonists may also be used to down regulate expression
 XX XX and activity. The anti-Gene 216 antibodies may also be used as diagnostic
 XX XX agents for detecting the presence of Gene 216 proteins in samples (e.g.
 XX XX by enzyme linked immunosorbant assay or ELISA). Disorders that may be
 XX XX prevented, diagnosed and/or treated by the above methods include, for
 XX XX example asthma, obesity and inflammatory bowel disease. The present
 XX XX sequence is that of a Gene 216 related primer used in examples of the
 XX XX invention. The primers are used in the physical mapping of the gene
 XX XX (ABZ72067-ABZ72088), polymorphism identification using single strand
 XX XX conformational polymorphism (SSCP) analysis (ABZ72091-ABZ72184),
 XX XX sequencing (ABZ72185-ABZ72268) and genotyping (ABZ72317-ABZ72362)

 PT Isolated genes (Gene 216) from human chromosome 20p13-p12 and the
 PT proteins they encode, useful for the prevention, diagnosis and treatment
 PT of asthma, obesity and inflammatory bowel disease.
 XX
 PS Example 10; Page 150; 520pp; English.
 XX
 CC The invention relates to isolated genes (Gene 216) from human chromosome
 CC 20p13-p12 and the proteins they encode. The nucleic acids and proteins
 CC may be used in the prevention, diagnosis and treatment of diseases
 CC associated with inappropriate Gene 216 expression. For example, the
 CC nucleic acids (or vectors) and proteins may be used to treat disorders
 CC associated with decreased expression by rectifying mutations or deletions
 CC in a patient's genome that affect the activity of gene 216 by expressing
 CC inactive proteins or to supplement the patients own production of Gene
 CC 216 proteins. Additionally, the nucleic acids may be used to produce the
 CC secreted Gene 216 protein, by inserting the nucleic acids into a host
 CC cell and culturing the cell to express the protein. The nucleic acids and
 CC complementary sequences may also be used as DNA probes in diagnostic
 CC assays to detect and quantitate the presence of similar nucleic acid
 CC sequences in samples and therefore which patients may be in need of
 CC restorative therapy. The Gene 216 protein may also be used as antigens in
 CC the production of antibodies against Gene 216 and in assays to identify
 CC modulators of Gene 216 expression and activity. The anti-Gene 216
 CC antibodies and antagonists may also be used to down regulate expression
 CC and activity. The anti-Gene 216 antibodies may also be used as diagnostic
 CC agents for detecting the presence of Gene 216 proteins in samples (e.g.
 CC by enzyme linked immunosorbant assay or ELISA). Disorders that may be
 CC prevented, diagnosed and/or treated by the above methods include, for
 CC example asthma, obesity and inflammatory bowel disease. The present
 CC sequence is that of a Gene 216 related primer used in examples of the
 CC invention. The primers are used in the physical mapping of the gene
 CC (ABZ72067-ABZ72088), polymorphism identification using single strand
 CC conformational polymorphism (SSCP) analysis (ABZ72091-ABZ72184),
 CC sequencing (ABZ72185-ABZ72268) and genotyping (ABZ72317-ABZ72362)

 PT Arraying genome clones.
 PT
 PS Claim 6; Page 56; 528pp; Japanese.
 XX
 CC The present invention describes a method of arraying genome clones. The
 CC method comprises: (a) clones of the genomic libraries contained in
 CC multiwell plates numbered for discrimination are mixed in each of the
 CC multiwell plates; (b) a primer designed based on the chromosome marker
 CC sequence is added to the mixture to carry out an amplification reaction;
 CC (c) a signal corresponding to the marker is detected from the resultant;
 CC amplified product to specify the discrimination Nos. of the multiwell
 CC plates containing the clones having said marker sequence; (d) the order
 CC of the markers is changed so that the same discrimination Nos. succeed to
 CC the maximum in the specified discrimination Nos. to array the multiwell
 CC plates; (e) the clones in the multiwell plates of the specified
 CC discrimination Nos. are mixed respectively in each wells of longitudinal
 CC and lateral directions; (f) the mixed clones are cultured and the
 CC resultant cultures are amplified by using the above primer; (g) signals
 CC are detected from the amplified products; (h) the clones in the multiwell
 CC plates are specified from the detected result; and (i) the clones are
 CC reconstituted as the positions on the chromosome and arrayed. The
 CC microarray is useful for gene analysis. ABL42957 to ABL45322 represent
 CC PCR primers for human chromosome lp36-35 DNA, and ABL45323 to ABL45634
 CC represent PCR primers for human chromosome 21q22.1, which are
 CC specifically claimed for use in the present invention

Example 6; Page 35; 54pp; English.

The invention relates to a method for amplifying a nucleic acid using a Single Primer Amplification (SPA). The method comprises synthesising a template nucleic acid containing a predetermined sequence and hairpin structure with the nested oligonucleotide extension reaction. The method is useful for amplifying a nucleic acid, preferably for amplifying a family of related nucleic acid sequences to build a complex library of polypeptides encoded by the sequences. The engineered nucleic acid strand is useful for amplifying a nucleic acid strand by providing a nucleic acid with a predetermined sequence engineered onto its first end, a sequence complementary to the predetermined sequence and a hairpin structure between them and contacting the engineered nucleic acid strand with a primer containing at least a portion of the predetermined sequence. This process is done in the presence of a polymerase and nucleotides under conditions suitable for polymerisation to produce a complementary nucleic acid strand. The method of the invention is useful for producing large amounts of a target nucleic acid sequence and for amplifying simultaneously more than one different target nucleic acid sequence located on the same or different nucleic acid molecules. This polynucleotide sequence represents an oligonucleotide relating to the invention

XX Treating a disorder associated with corticotropin releasing factors, e.g.
PT psychiatric disorders, involves administering CRF1 and CRF2 receptor
PT ligands or CRF1 receptor ligand and CRF2 antisense oligonucleotide.

XX

Claim 10; Page 36; 50pp; English.

The invention relates to a method of treating disorders associated with corticotropin releasing factor (CRF)1 and CRF2 receptor activities. The method involves administering CRF1 and CRF2 receptor ligands, or CRF1 receptor ligand and CRF2 antisense oligonucleotides. The antisense oligonucleotide is composed of chimeric sequences, where 10-70% of the 2'-deoxyribonucleotide phosphorothioate residues are replaced with modified nucleotide residues. The invention is useful for treating psychiatric disorders e.g. anxiety, obsessive-compulsive disorder, panic disorder, post-traumatic stress disorder, phobia and depression, and other disorders including head trauma, spinal cord trauma, ischaemic neuronal damage (e.g. cerebral ischaemia such as cerebral hippocampal ischaemia), excitotoxic neuronal damage, epilepsy, stroke, stress induced immune dysfunction, phobias, muscular spasms, Parkinson's disease, Huntington's disease, urinary incontinence, senile dementia of the Alzheimer's type, multi-infarct dementia, amyotrophic lateral sclerosis, chemical dependencies and addictions (e.g. dependencies on alcohol, cocaine, heroin, benzodiazepines, or other drugs, and hypoglycaemia. The present sequence is an antisense oligonucleotide directed against rat CRF2 receptor mRNA

XX New NOVX polypeptides and nucleic acids, useful for diagnosing,
 PT preventing or treating NOVX-associated disorders, e.g. diabetes, obesity,
 PT cancer or dyslipidemia, and in chromosome mapping, tissue typing or
 PT pharmacogenomics.
 XX Example C; Page 411; 586pp; English.
 XX The present invention describes NOVX proteins, where X can be 1 to 55
 CC (e.g. NOV1). Also described: (1) a composition, comprising a polypeptide
 CC described above and a carrier; (2) a kit comprising, in one or more
 CC containers, the composition described above; (3) an isolated nucleic acid
 CC molecule which encodes a NOVX protein of the invention; (4) a vector
 CC comprising the nucleic acid molecule described above; (5) a cell
 CC comprising the above vector; (6) an antibody that immunospecifically
 CC binds to the polypeptide described above; (7) methods for determining the
 CC presence or amount of the above polypeptide or nucleic acid molecule in a
 CC sample; (8) methods for determining the presence of or predisposition to
 CC a disease associated with altered levels of expression of the above
 CC polypeptide or nucleic acid molecule in a first mammalian subject; (9) a
 CC method of identifying an agent that binds to the polypeptide described
 CC above; (10) a method for identifying a potential therapeutic agent for
 CC use in treating a pathology that is related to an aberrant expression or
 CC aberrant physiological interactions of the polypeptide; (11) a method of
 CC screening for a modulator of activity or of latency or predisposition to
 CC a pathology associated with the polypeptide; (12) a method for modulating
 CC the activity of the polypeptide described above; (13) methods of treating
 CC or preventing a pathology associated with the above polypeptide in a
 CC mammal; and (14) a method for producing the above polypeptide. NOVX
 CC sequences have antidiabetic, anorectic, antibacterial, virucide,
 CC immunomodulator, cytostatic, nootropic, neuroprotective, antiparkinsonian
 CC and antilipemic activities, and can be used in gene therapy. The
 CC polypeptide is useful in manufacturing a medicament for treating a
 CC syndrome associated with a human disease. The polypeptide or the nucleic
 CC acid molecule may be used to diagnose, treat or prevent metabolic
 CC disorders such as diabetes or obesity, infections, cachexia, cancer,
 CC neurodegenerative disorders such as Alzheimer's disease or Parkinson's
 CC disease, immune disorders, haematopoietic disorders and various
 CC dyslipidaemias. The nucleic acids can also be used as hybridisation
 CC probes, in chromosome mapping, tissue typing, preventive medicine and
 CC pharmacogenomics. The present sequence represents a PCR primer for a
 CC human NOVX sequence, which is used in an example from the present
 CC invention.

XX New non-human transgenic animal, useful as a specific receptor occupancy
PT model for modulators of the B1 bradykinin receptor, or as an animal model
PT system for assessing the pharmacodynamic properties of B1 bradykinin
PT modulators.
XX Example 2; Page 24; 66pp; English.
XX The invention discloses a non-human transgenic animal having incorporated
CC into its genome at least one copy of a transgene encoding a primate
CC bradykinin B1 receptor gene, or its functional equivalent, such that the
CC transgenic animal demonstrates a humanised B1 bradykinin receptor (hB1)
CC occupancy or binding profile. The transgenic animal, preferably
CC transgenic rat, can also be used for the discovery of B1 bradykinin
CC receptor modulators as well as providing a system for the assessment of
CC the pharmacodynamic properties of B1 bradykinin receptor modulators,
CC such as antagonists or agonists of receptor activity. The B2 and B1
CC bradykinin receptors are members of the superfamily of G-protein coupled
CC receptors (GPCR). The sequence presented is a PCR primer, #1, which
CC was used to detect transgene insertion during creation of a transgenic
CC rat

 PT New antisense oligonucleotides targeted to a nucleic acid encoding acyl
 PT coenzyme A cholesterol acyltransferase-1, useful for treating a
 PT disease/condition involving abnormal lipid or cholesterol metabolism,
 PT e.g. atherosclerosis.
 XX
 PS Claim 3; Page 91; 117pp; English.
 XX
 CC Sequences ABZ74897-ABZ74942 represent antisense oligonucleotides targeted
 CC to the human or murine acyl coenzyme A cholesterol acyltransferase-1
 CC gene, which inhibit its expression. The antisense oligonucleotides were
 CC designed to target different regions of the human or murine acyl coenzyme

CC A cholesterol acyltransferase-1 RNA, and were analysed for their effect
 CC on acyl coenzyme A cholesterol acyltransferase-1 mRNA levels by
 CC quantitative real-time PCR. Acyl coenzyme A cholesterol acyltransferase
 CC (ACAT) enzymes catalyse the synthesis of cholesterol esters from free
 CC cholesterol and fatty acyl-CoA, and are also involved in regulating the
 CC concentration of cellular free sterols. The human acyl coenzyme A
 CC cholesterol acyltransferase-1 is the predominant ACAT isoform in the
 CC liver, and the gene encoding it is located on chromosome 1q25, although a
 CC subsequent study has indicated that one acyl coenzyme A cholesterol
 CC acyltransferase-1 mRNA is produced from genes on two different
 CC chromosomes (chromosomes 1 and 7) by a novel RNA recombination mechanism
 CC involving trans-splicing of the two discontinuous precursor mRNAs. The
 CC oligonucleotides of the invention are useful for the prevention and
 CC treatment of conditions associated with acyl coenzyme A cholesterol
 CC acyltransferase-1, such as disorders involving abnormal lipid or
 CC cholesterol metabolism, e.g., atherosclerosis or cardiovascular disease.
 CC They are also useful in research and diagnostics for modulating the
 CC expression of acyl coenzyme A cholesterol acyltransferase-1

 PT Microorganism detecting composition comprises dideoxynucleotide
 PT triphosphate(s) corresponding to one of four deoxynucleotide
 PT triphosphates, and thermally stable polymerase enzyme.
 XX
 PS Disclosure; Page 35; 94pp; English.

XX CC The invention relates to a microorganism detecting composition. The
 CC composition is used for detecting a target microorganism. It is used in a
 CC bi-directional DNA sequencing method in several contexts including
 CC detection of mutations, particularly mutations of medical significance,
 CC in samples derived from a human patient, animal, plant, or microorganism;
 CC determination of HLA (human leukocyte antigen) type ancillary to
 CC transplant procedures, detection and identification of microorganisms,
 CC particularly pathogenic microorganisms, in a sample and in situ
 CC sequencing reactions to produce sequencing fragments within a
 CC histological specimen which are then removed from a selected location on
 CC the tissue preparation and loaded onto a gel for sequence analysis. The
 CC invention allows an evaluation to be directly performed on a natural
 CC abundance DNA sample. It provides for bi-directional sequencing of DNA
 CC which requires combining a complex DNA-containing sample with only a
 CC single reaction mixture, thus reducing risk of error and contamination,
 CC and increasing the ease with which the procedure can be automated. The
 CC present sequence represents a sequencing primer for identification of a
 CC microorganism.

 PT alpha.
 XX

PS Claim 2; Page 12; 142pp; English.
 XX The invention describes a method of treating an inflammatory disorder in
 CC an individual, comprising administering to the individual an
 CC oligonucleotide upto 30 nucleotides in length complementary to a nucleic
 CC acid molecule encoding human tumor necrosis factor (TNF)-alpha. The
 CC method is useful for treating an inflammatory disorder such as
 CC inflammatory bowel disease, Crohn's disease, colitis or rheumatoid
 CC arthritis, in an individual. The method is also useful for treating
 CC diabetes, pancreatitis, multiple sclerosis, atopic dermatitis, asthma,
 CC and hepatitis in an individual. This sequence represents an antisense
 CC oligonucleotide used to modulate expression of tumour necrosis factor
 CC alpha (TNF-alpha)

XX
CC The present invention describes compounds (I) comprising 8-50 nucleobases
CC in length targeted to a nucleic acid molecule encoding a microsomal
CC triglyceride transfer protein, where the compounds specifically hybridise
CC with and inhibit the expression of the microsomal triglyceride transfer
CC protein. Also described: (1) a compound 8-50 nucleobases in length which
CC specifically hybridises with at least an 8-nucleobase portion of an
CC active site on a nucleic acid molecule encoding microsomal triglyceride
CC transfer protein; (2) a composition comprising (I) and a carrier or
CC diluent; (3) inhibiting the expression of microsomal triglyceride
CC transfer protein in cells or tissues, comprising contacting the cells or
CC tissues with (I) so that expression of microsomal triglyceride transfer
CC protein is inhibited; and (4) treating an animal having a disease or
CC condition associated with microsomal triglyceride transfer protein,
CC comprising administering (I) to the animal so that expression of
CC microsomal triglyceride transfer protein is inhibited. (I) have cardiant,
CC antiarteriosclerotic and antilipemic activities, and can be used in
CC antisense gene therapy. The methods and compositions of the present
CC invention are useful for the diagnosis, prevention and/or treatment of
CC diseases or conditions associated with aberrant expression or activity of
CC microsomal triglyceride transfer protein, such as an abnormal lipid or
CC cholesterol metabolism condition like atherosclerosis and cardiovascular
CC disease. The present sequence represents a mouse microsomal triglyceride
CC transfer protein chimeric phosphorothioate antisense oligonucleotide,
CC which is used in an example from the present invention.

XX A recombinant adeno-associated virus-vectored ribozyme composition,
 PT useful for treating a disease or dysfunction of the mammalian eye e.g.
 PT retinal disease, e.g. diabetic retinopathy or age-related macular
 PT degeneration.
 XX
 PS Example 5; Page 63; 115pp; English.

XX The present invention describes a recombinant adeno-associated virus
 CC (AAV) vectored ribozyme composition (I). (I) comprises: (a) at least a
 CC first ribozyme that specifically cleaves an mRNA encoding a protein,
 CC polypeptide, or peptide selected from the group of rod opsin, iNOS,
 CC RGS/peripherin, VEGFR1, VEGFR2, adenosine A-2B receptor, IGF-1, integrin
 CC alpha 1, integrin alpha 3, integrin alpha 5, or integrin alpha V; (b) a
 CC vector comprising a polynucleotide encoding the ribozyme, where the
 CC polynucleotide operably positioned downstream of at least a first
 CC promoter that directs expression of the polynucleotide in a selected
 CC mammalian cell transformed with the vector; (c) a viral particle
 CC comprising the ribozyme or the polynucleotide; (d) an AAV vector
 CC comprising the ribozyme or the polynucleotide; or (e) a host cell

CC comprising the ribozyme or the polynucleotide. Also described is a method
 CC for decreasing the amount of mRNA encoding a selected polypeptide in a
 CC retinal cell of a mammalian eye, comprising providing to the eye the
 CC composition described above, and for a time effective to specifically
 CC cleave the mRNA in the cell. (I) has ophthalmological activity, and can
 CC be used in gene therapy. (I) can be used for treating a disease or
 CC dysfunction of the mammalian eye, such as a retinal disease or retinal
 CC degeneration. (I) is also useful for manufacturing a macular
 CC treating the diseases mentioned above, including autosomal dominant
 CC retinitis or a blood-retinal barrier dysfunction. (I) can also be useful
 CC for treating, decreasing the severity, or ameliorating the symptoms of a
 CC pathological condition, e.g. atrophic or pigmented lesions of the eye,
 CC blindness, a reduction in central or peripheral vision, or a reduction in
 CC total vision. ABZ72763 to ABZ72953 represent sequences used in the
 CC exemplification of the present invention

XX New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA -
 PT useful for preventing or treating initial development, progression or
 PT regression of vascular diseases, esp. familial hypercholesterolaemia.

XX Claim 4; Page 42; 72pp; English.

XX AAAT50138-T50359 represent target sequences for the rabbit cholesterol
 CC ester transfer protein (CETP) hammerhead (HH) ribozymes (see AAAT50360-
 CC T50546). CETP is a 74 kD glycoprotein that facilitates neutral lipid
 CC transfer between plasma lipoproteins. The numbering of the targets refers

CC to the position of the cleavage site in full length CETP. The ribozyme
CC then binds to 5 nucleotides either side of this site. The ribozymes are
CC able to cleave mRNA from the gene encoding CETP, thereby blocking
CC synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse
CC cholesterol transport (RCT) pathway can be inhibited (or eliminated)
CC thereby preventing the reduction in size density of the high density
CC lipoproteins (HDL), prolonging HDL half life, and therefore increasing
CC HDL levels. The ribozymes can be used to treat conditions associated with
CC abnormal levels of CETP, specifically atherosclerosis, familial
CC hypercholesterolaemia, peripheral vascular disease, dyslipidaemia,
CC hyperbetalipoproteinemia, hypobetalipoproteinemia, vascular
CC complications of diabetes, transplant, atherectomy and angioplastic
CC restenosis. By inhibiting CETP, the levels of HDL and low density
CC lipoproteins (LDL), and the HDL:LDL ratio are favourably altered (a
CC decrease in LDL levels, and a corresponding increase in HDL levels). The
CC HH ribozymes can also be used diagnostically to study genetic drift and
CC mutations in diseased cells, and to detect CETP mRNA. As the HH ribozymes
CC target specific regions of the CETP gene, they have low non-specific
CC activity

XX Genotyping human apolipoprotein gene of individual for determining
XX haplotype of individual, involves determining identity of nucleotide pair
XX at specific polymorphic sites for two copies of gene.
XX
XX Claim 16; Page 14; 78pp; English.
XX The patent discloses novel genetic variants of human apolipoprotein E
XX (APOE) gene. The invention also relates to compositions and methods for
XX haplotyping and/or genotyping the APOE gene. The haplotyping methods of
XX the invention are useful for improving the efficacy and reliability of

CC several steps in the discovery and development of drugs for treating
CC diseases associated with APOE activity, e.g. familial
CC dysbetalipoproteinemia, type III hyperlipoproteinemia, atherosclerosis,
CC and Alzheimer's disease. They are useful to validate APOE as a candidate
CC agent for treating a specific condition or disease predicted to be
CC associated with APOE activity and in the design of clinical trials of
CC candidate drugs for treating a specific condition or disease predicted to
CC be associated with APOE activity. Genotyping or haplotyping methods are
CC useful to screen for compounds targeting APOE to treat a specific
CC condition or disease associated with APOE activity. The present DNA
CC sequence is an allele specific oligonucleotide (ASO) primer which is used
CC for detecting human APOE gene polymorphisms

XX PT New isolated nucleic acid segments from the human genome - used for
 PT determining polymorphic forms for use in e.g. forensics, paternity
 PT testing or phenotypic typing for disease.

XX PS Claim 16; Page 85; 310pp; English.

XX CC AAX09121-X10268 are allele-specific oligonucleotide primers used in the
 CC isolation of various biallelic polymorphic markers found in the human
 CC genome (represented in AAX10269-X12937). These primers can be used in a
 CC method for determining polymorphic forms in an individual for use in e.g.
 CC forensics, paternity testing or for phenotypic typing for diseases such
 CC as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
 CC dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial
 CC hypercholesterolemia, polycystic kidney disease, hereditary
 CC spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary
 CC haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos
 CC syndrome, osteogenesis imperfecta, acute intermittent porphyria,
 CC autoimmune diseases, inflammation, cancer, diseases of the nervous
 CC system, infection by pathogenic microorganisms, and characteristics such
 CC as longevity, appearance (e.g. baldness, obesity), strength, speed,
 CC endurance, fertility, and susceptibility or receptivity to particular
 CC drugs or therapeutic treatments. The isolated polymorphic nucleic acid
 CC segments can also be used to produce medicaments for the treatment or
 CC prophylaxis of such diseases

XX PT New isolated nucleic acid, useful for treating viral diseases associated
XX PT with tumors and cell degeneration, also related polypeptides, antibodies
XX PT and transfected cells.
XX PS Disclosure; Page 65; 720pp; French.
XX CC The invention relates to a novel isolated 17 mer nucleic acid sequence,
XX CC given in the specification, a sequence containing at least 15 consecutive
XX CC nucleotides from the 17 mer sequence, a sequence with, after optimal
XX CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
XX CC hybridizes to them under highly stringent conditions, or the complement
XX CC of any of them, or the corresponding RNA. The novel isolated nucleic
XX CC acids of the invention are useful as probes and primers for detecting,
XX CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
XX CC component of a gene chip, in vitro as (anti)sense reagents, and for
XX CC production of recombinant polypeptides. Any of the nucleic acids,
XX CC polypeptides, vectors containing the nucleic acids, cells containing the
XX CC vector or antibodies directed against the polypeptides are useful for
XX CC preparation of pharmaceuticals for prevention and/or treatment of viral
XX CC diseases that are characterised by development of tumours or cell
XX CC degeneration, specifically cancer but also Alzheimer's disease and
XX CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
XX CC patient samples is useful for diagnosis and/or prognosis of these
XX CC diseases. The polypeptides can also be used to generate antibodies, and
XX CC both the polypeptide and antibodies are useful as components of protein
XX CC chips. The nucleic acid sequences of the invention can be used in gene
XX CC therapy. This polynucleotide sequence represents a tumour suppression
XX CC related human fukutin oligonucleotide of the invention

XX PT New nucleic acid encoding human prostate membrane-specific antigen,
XX PT useful e.g. for treatment of tumors and viral infection, also related
XX PT polypeptide and antibodies.
XX PS Disclosure; Page 614; 771pp; French.
XX CC The invention relates to the isolation of 6327 nucleotide sequences,
XX CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
XX CC sequence having at least 80% identity, after optimal alignment, with the
XX CC nucleotides, a sequence that hybridizes under stringent conditions with
XX CC the nucleotides, or the complement, or corresponding RNA, of the
XX CC nucleotides. The nucleotides are used as probes or primers for detecting,
XX CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
XX CC sense and antisense sequences, of nucleotides involved in tumour
XX CC suppression or reversion, apoptosis and or viral resistance, to produce
XX CC recombinant polypeptides, and to prepare transgenic animals, as
XX CC experimental models. The nucleotides (also vectors containing them and
XX CC cells containing the vectors), the encoded polypeptides and antibodies
XX CC (Ab) against the polypeptide are useful for prevention and/or treatment
XX CC of viral infections or diseases characterized by development of tumours
XX CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
XX CC Analysis of the expression of the nucleotides can be used for diagnosis
XX CC and/or prognosis of these diseases. The nucleotides and polypeptides can
XX CC also be used to screen for their specific interactive molecules.
XX CC potentially useful for treating diseases associated with abnormal
XX CC expression of the nucleotides.

 XX
 PT Example 2; Page 29; 64pp; English.
 XX
 PS This invention describes the construction of libraries of antibody
 CC variable domains containing modified complementarity determining regions
 CC (CDRs) carrying a cysteine noose and which have cytokine agonist and
 CC antagonist mechanisms of action. The method of the invention can be used
 CC to obtain peptide ligand mimetics capable of binding a target antigen.
 CC The binding members may also be used to provide agonists or antagonists
 CC of targets such as cytokines. In particular specific binding members for
 CC MIP-1 alpha receptors are useful for treatment of HIV infection and for
 CC in vitro investigation of mechanisms of HIV infection. A selection of
 CC peptide ligand mimetics from CDR3 cysteine noose libraries provide a
 CC means to select a different and potentially more effective population of
 CC peptide ligands than direct display of similar cysteine noose ligands on
 CC the surface of bacteriophage. The products of the invention have anti-HIV
 CC activity

XX Detection of adjacent and non-adjacent locus, e.g. HLA alleles - by
XX amplifying genomic DNA, for direct determination of haplotype.
XX
XX Claim 29; Page 49; 53pp; English.
XX
XX The primer is specific for nt 1667-1685 of HLA Class I A2 locus. It is
XX used in a method for the prodn. of RFLP fragments for an HLA locus,
XX together with a second primer making up a locus-specific primer (LSP)
XX pair. It is pref. used with a Class I-specific primer which hybridises
XX with at least two different Class I loci, pref. at least one of each of
XX A, B, and C, and most pref. all of these. The Class I primer esp.
XX hybridises with intervening sequence (IVS) III or IVS I sequences. Direct
XX determination of the haplotype is possible, providing useful information
XX for identity of individuals for e.g. paternity case and forensic
XX investigations. See also AAQ10621-Q10669. (Updated on 25-MAR-2003 to
XX correct PA field.)

 XX Collection of binding groups for determining or typing samples,
 PT especially clinical samples, has groups capable to identify essentially
 PT all members of the family of nucleic acids of relatively high
 PT significance.
 XX
 XX Disclosure; Page 37; 166pp; English.
 PS
 XX The present invention describes a collection of binding groups for a
 CC family of nucleic acids comprising members of relative high and relative
 CC low significance, where the binding groups are selected to be capable to
 CC identify, alone or in combination, essentially all members of the family
 CC of nucleic acids of relatively high significance. The collection of
 CC binding groups is useful for typing of nucleic acid in a clinical sample,
 CC by contacting the nucleic acid with the collection and determining
 CC whether one or more binding groups bound to the nucleic acid of the
 CC sample. This method is useful for determining whether the sample
 CC comprises at least a part of a member of relatively high significance of
 CC a family of nucleic acids. The collection of binding groups is useful for
 CC diagnosing the severity of a disease caused by a pathogen containing a
 CC member of a family of nucleic acids. ABL88779 to ABL89321 represent
 CC oligonucleotide sequences used in the exemplification of the present
 CC invention

 XX Screening method for new Gaucher disease mutation - comprises inserting
 PT guanine nucleotide adjacent to specified position of gluco-cerebrosidase
 PT gene-exon 2.
 XX
 XX Claim 25; Page 66; 74pp; English.
 PS
 XX The sequences given in AAQ39288-303 are primers and probes which were
 CC used in a method to detect a mutation in the glucocerebrosidase gene,
 CC corresponding to an insertion of a G nucleotide adjacent to base 57 of
 CC exon 2 (see also AAQ39287 and AAQ39304). The template DNA used was
 CC isolated from peripheral blood leukocytes. Glucocerebrosidase is an
 CC enzyme which is required for the lysosomal degradation of glycolipids
 CC (see also AAQ39286). A deficiency of this enzyme leads to Gaucher
 CC disease, as in the absence of glucocerebrosidase, the extremely insoluble
 CC glucosylceramide (glucocerebroside) accumulates. The insertion of a G
 CC nucleotide adjacent to position 84 in the glucocerebrosidase cDNA has
 CC been characterised as a new Gaucher disease causing mutation. The
 CC corresponding position of this mutation in the gluco-cerebrosidase gene
 CC is in exon 2, adjacent to position 57. (Updated on 25-MAR-2003 to correct
 CC PN field.)

 PT New expression vector comprising promoter capable of directing expression
 PT of a coding sequence in angiosperm cell.
 XX
 PS Example 2; Page 8; 21pp; English.
 XX
 CC This invention describes a novel expression vector comprising a promoter
 CC capable of directing expression of a coding sequence in an angiosperm
 CC cell, and a 3' untranslated region of a rice alpha-amylase gene where
 CC after the coding sequences is inserted into the vector, the 3'
 CC untranslated region and the coding sequence are transcribed into a single
 CC mRNA. 3' untranslated regions of rice alpha-amylase gene can cis-regulate
 CC mRNA stability in angiosperm cells in a sugar-responsive manner
 CC especially for gene expression regulation in plants, regenerating tissue
 CC or even regenerating a whole plant. The full length 3' untranslated
 CC region of a rice alpha-amylase gene (alphaAMY3) enhances mRNA stability
 CC in the absence of sugar and promotes mRNA degradation in the presence of

CC sugar and that fragments of the above mRNA can independently regulate
 CC mRNA accumulation in a sugar responsive manner

 XX New compound targeted to nucleic acid molecule encoding telomerase
 PT transcriptase (TERT), which specifically hybridizes with and inhibits
 PT expression of TERT, useful for modulating apoptosis and inhibiting cell
 PT growth.
 XX
 XX Claim 13; Page 85; 154pp; English.
 PS
 XX The invention describes a compound, 8-50 nucleobases in length targeted
 CC to a nucleic acid molecule encoding human TERT (telomerase reverse
 CC transcriptase), where the compound specifically hybridizes with and
 CC inhibits the expression of TERT. A series of oligonucleotides were
 CC designed to target different regions of the human TERT RNA. These were 20
 CC nucleotides in length and composed of a central gap region consisting of
 CC ten 2'-deoxynucleotides, flanked on both sides (5' and 3' directions) by
 CC five-nucleotide wings. The wings were composed of 2'-methoxyethyl (2'-
 CC MOE) nucleotides. The compounds were analysed for their effect on human
 CC TERT mRNA levels by reverse transcriptase (RT)-polymerase chain reaction
 CC (PCR). The compound is useful for inhibiting the expression of TERT in
 CC cells or tissues, for treating a human having disease or condition
 CC associated with TERT, for modulating apoptosis, for inhibiting cell
 CC growth (preferably, cancer cell growth), in antisense therapy and for
 CC diagnostics and therapeutics. This sequence is an antisense
 CC oligonucleotide used to modulate the activity of nucleic acid molecules
 CC encoding TERT, described in the method of the invention

 XX Designing capture oligonucleotide probes for use on a support to which
 PT complementary oligonucleotides hybridize with little mismatch.
 PT
 XX
 XX Example 5; Fig 29; 300pp; English.
 PS
 XX The present invention describes a method (M1) for designing capture
 CC oligonucleotide probes (I) for use on a support to which complementary
 CC oligonucleotide probes (II) will hybridize with little mismatch, where
 CC (I) have melting temperatures within a narrow range. The method is useful
 CC for detecting infectious diseases caused by bacterial infectious agents
 CC e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal
 CC infectious agents e.g. Cryptococcus neoformans, Candida albicans and
 CC Aspergillus fumigatus, viruses e.g. T-cell lymphocytotropic virus,
 CC Epstein-Barr virus and polio virus, and parasitic infectious agents
 CC selected from Onchocerca volvulus, Entamoeba histolytica and Dracunculus
 CC medinensis. The method is also useful for detecting genetic diseases such
 CC as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
 CC Detecting cancer involving oncogenes, tumour suppressor genes, or genes
 CC involved in DNA amplification, replication, recombination or repair, the
 CC cancer is specifically associated with a gene selected from BRCA1 gene,
 CC p53 gene, human papillomavirus types 16 and 18 and liver cancers. The
 CC method is also used for environmental monitoring, forensics and the food
 CC and feed industry, detecting comprises scanning (using e.g. a scanning
 CC electron microscope and infrared microscope) the support at the
 CC particular sites and identifying if ligation of the oligonucleotide probe
 CC sets occurred and correlating (using a computer) identified ligation to a
 CC presence or absence of the target nucleotide sequences. ABI82074 to
 CC ABI97546 represent oligonucleotide sequences used in the exemplification
 CC of the present invention

 PT Pharmaceutical composition for treating ailments associated with impaired
 PT respiration, has oligo(s) antisense to specific gene(s) or its
 PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
 PT ubiquinone.
 XX
 PS Disclosure; SEQ ID NO 5351; 872pp; English.
 XX
 CC The invention relates to a novel pharmaceutical composition, which has a
 CC first active agent comprising an oligonucleotide antisense to the
 CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
 CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
 CC junctions of genes encoding a polypeptide associated with lung and/or
 CC nasal airway dysfunction and a second active agent comprising an
 CC antiinflammatory steroid and ubiquinone. A composition of the invention
 CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
 CC immunosuppressive, and cytostatic activity. The composition may have a
 CC use in antisense gene therapy. The composition is useful for treating or
 CC preventing a respiratory, lung or malignant disease or condition, also
 CC for enhancing the prophylactic or therapeutic respiratory effect of an
 CC antiinflammatory steroid in a subject, for reducing or depleting levels
 CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
 CC receptor, producing bronchodilation, increasing levels of ubiquinone or
 CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
 CC lung inflammation, lung allergies, or a respiratory disease or condition.

 XX
 XX New enzymatic RNA molecules - which cleave mRNA of a gene encoding a
 PT matrix metalloproteinase, for treating arthritis, cancer or angiogenesis.
 XX
 XX Disclosure; Page 18; 70pp; English.
 XX
 XX The sequences AAQ93462-Q93494 are examples of target cleavage sequences
 CC for a hammerhead ribozyme with sequence motif AAQ90453. A ribozyme, pref.
 CC hammerhead, hairpin, hepatitis delta virus, group 1 intron or RNase P RNA
 CC motif can be used in a composition for the treatment of arthritis, cancer
 CC or angiogenesis. The ribozymes comprises between 5-45 bases complementary
 CC to the target mRNA. The ribozymes (see AAQ93830-51 for examples) were
 CC synthesised based on putative stromelysin mRNA target cleavage sequences
 CC (AAQ93496-Q93829). (Updated on 25-MAR-2003 to correct PN field.)

 DR
 XX Enzymatic nucleic acid molecules having a hammer-head motif - used for
 PT the treatment of arthritis, induction of graft tolerance or treatment of
 PT auto-immune diseases.
 XX
 XX Example 1; Page 139; 307pp; English.
 PS
 XX The present invention describes a novel enzymatic nucleic acid (ENA)
 CC having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
 CC ; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least
 CC ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
 CC can inhibit collagenase and stromelysin production in the synovial
 CC membrane of joints for the treatment or prevention of arthritis,
 CC particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
 CC be used to treat antigen presenting cells of a donor to induce tolerance
 CC in a recipient to an alloantigen of a donor. They can also be used for
 CC enhancing graft tolerance or for treating autoimmune disease, and for
 CC treating allergies and other inflammatory conditions. The ENA's can also
 CC be used in diagnosis. Ribozyme therapy impacts on the expression of
 CC stromelysin without introducing the non-specific effects upon gene
 CC expression which accompany treatment with retinoids and dexamethasone.
 CC The concentration of ribozyme required to affect a therapeutic treatment
 CC is lower than that required of antisense molecules, and is highly
 CC specific. The present sequence is used in the exemplification of the
 CC present invention

 XX Identifying new catalytic nucleic acid that modulates selected processes
 PT - especially ribozymes that cleave Raf RNA for treating cancer,
 PT restenosis, and also new ribozymes and modified nucleoside triphosphates
 PT used as antiviral agents and synthons.
 XX Claim 177; Page 150; 259pp; English.
 XX A method has been developed for the identification of a nucleic acid
 CC capable of modulating a process in a biological system. The method
 CC comprises: (a) introducing into the system a random library of nucleic
 CC acid catalysts (NAC) having a substrate binding domain (SBD), comprising
 CC a random sequence, and a catalytic domain (CD); and (b) identifying NAC
 CC in systems where modulation has occurred and/or determining the sequence
 CC of at least part of the SBDs in such systems. Nucleic acid molecules with
 CC endonuclease activity and catalytic activity, from the present invention,
 CC are used to modulate gene expression in plant and mammalian cells and to
 CC cleave target nucleic acid, particularly for treating systemic diseases
 CC caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic
 CC ascites and infection. They may also be used to detect genetic drift and
 CC mutations in diseased cells and to determine c-raf RNA. Specifically NACs
 CC with RNA-cleaving activity that modulate expression of the Raf gene, are
 CC used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
 CC generally any condition associated with the level of c-raf. Introduction
 CC of sugar/phosphate modifications increases stability against nuclease and
 CC activity. AAV90922 to AAV93877 represent NACs that can be used in the
 CC method, specifically for modulating the expression of a Raf gene

 XX New nucleic acids that interact, and optionally cleave, target sequences,
 PT used to treat cancer.
 XX Claim 77; Page 87; 148pp; English.
 XX The present invention describes nucleic acids (A) that interact stably
 CC with a target sequence and contain at least one phosphorodithioate
 CC link, having endonuclease activity. (A), and more generally any catalytic
 CC nucleic acid (A') that modulates expression of the oestrogen receptor
 CC gene, are used to treat cancer (particularly of breast or endometrium),
 CC in vivo or by transforming cells ex vivo and implanting treated cells, or
 CC for other conditions associated with levels of oestrogen receptor.
 CC Because of the high selectivity for targeted RNA, (A) can also be used to
 CC correlate inhibition of gene expression with alterations in phenotype,
 CC particularly for identification of therapeutic targets, and as research
 CC reagents (for RNA, in the same way that restriction endonucleases are
 CC used with DNA). The combination of modifications in (A) improves
 CC resistance to nucleases, binding affinity and/or activity. AAA23503 to
 CC AAA24748 represent oestrogen receptor hammerhead ribozyme sequences, and
 CC AAA25993 to AAA26105 represent their corresponding target sequences.
 CC sequences, and AAA26107 to AAA26218 represent their corresponding target
 CC sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
 CC antisense oligonucleotides used in the exemplification of the present
 CC invention

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
 constructs, which down regulate expression of a CD20 gene or neurite
 growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
 central nervous system injury.

Claim 30; Page 159; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates
 expression of a CD20 gene and a nucleic acid molecule which down
 regulates expression of a neurite growth inhibitor gene (NOGO). The
 nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
 DNAzyme) an inozyme (an endolytic nucleic acid cleaving an RNA molecule
 possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or
 an amberzyme (cleaving RNA with an NGN triplet), a zinczyme (cleaving RNA
 with a Ycf motif). The CD20-targeting nucleic acid is used to cleave RNA
 of CD20 in the presence of a divalent cation that is preferably Mg²⁺.
 Furthermore, it may be contacted with a cell to reduce CD20 activity of
 the cell and treat a patient having a condition associated with the level
 of CD20. The treatment may further comprise the use of one or more
 therapies. In particular, the CD20 targeting nucleic acid may be used to
 treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
 Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
 leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
 lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
 immune thrombocytopenia, and inflammatory arthropathy. The NOGO-
 targeting nucleic acid is used to cleave RNA of the NOGO gene in the
 presence of a divalent cation that is preferably Mg²⁺. Furthermore, the
 nucleic acid may be contacted with a cell to reduce NOGO activity of the
 cell and treat a patient having a condition associated with the level of
 NOGO. The treatment may further comprise the use of one or more
 therapies. In particular, the NOGO-targeting nucleic acid may be used to
 treat central nervous system (CNS) injury and cerebrovascular accident
 (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
 chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
 Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
 disease, muscular dystrophy, and/or other neurodegenerative disease
 states which respond to the modulation of NOGO expression. The present
 sequence is a DNAzyme molecule of the invention

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
constructs, which down regulate expression of a CD20 gene or neurite
growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
central nervous system injury.
XX
Claim 88; Page 94; 200pp; English.
XX
The invention relates to a nucleic acid molecule which down regulates
expression of a CD20 gene and a nucleic acid molecule which down
regulates expression of a neurite growth inhibitor gene (NOGO). The
nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
DNazyme) an inozyme (an endolytic nucleic acid cleaving an RNA molecule
possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or
an amberzyme (cleaving RNA with an NGN triplet), a zinzyne (cleaving RNA
with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA
of CD20 in the presence of a divalent cation that is preferably Mg2+.
Furthermore, it may be contacted with a cell to reduce CD20 activity of
the cell and treat a patient having a condition associated with the level
of CD20. The treatment may further comprise the use of one or more
therapies. In particular, the CD20 targeting nucleic acid may be used to
treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic

 DR New polypeptide, for raising antibodies that recognize hGDMPLP-1 proteins,
 PT or as specific biomolecule capture probes for surface-enhanced laser
 PT desorption ionization, comprises human myosin-like protein hGDMPLP-1.
 XX
 PS Disclosure; SEQ ID NO 227; 214pp; English.
 XX
 CC The present invention describes a human genome-derived myosin-like
 CC protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
 CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
 CC nucleic acids can be used as probes to detect, characterise and quantify
 CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
 CC provide initial substrates for the recombinant engineering of hGDMPLP-1
 CC protein variants having desired phenotypic improvements, and for
 CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
 CC used as immunogens to raise antibodies that specifically recognise hGDMPLP
 CC -1 proteins, as standards in assays used to determine the concentration
 CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule
 CC capture probes for surface-enhanced laser desorption/ionisation, as
 CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1
 CC production, and in vaccines or for replacement therapy. The
 CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
 CC disorder associated with the expression of hGDMPLP-1, in particular heart
 CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
 CC The present sequence represents an oligomer used in the screening of the
 CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
 CC The sequence data for this patent did not form part of the printed
 CC specification, but was obtained in electronic format directly from WIPO

XX Novel isolated human testis expressed Patched like protein (HTPL), useful
 PT for identifying agonist and antagonist and specific binding partners, and
 PT for treating subjects having defects in HTPL.

XX Example 2; Page 269; 718pp; English.

XX The present invention relates to human testis expressed Patched like
 CC protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL
 CC has two isoforms, with a few single base pair differences between the
 CC two. One of the single base pair changes introduces a premature stop
 CC codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL
 CC shares an overall structure organisation with the Patched protein. The
 CC shared structural features strongly imply that HTPL plays a role similar
 CC to that of Patched, and is a potential tumour suppressor. HTPL is
 CC important in regulating male germ cell development, and the HTPL gene
 CC mapped to human chromosome 10p12.1. HTPL and its coding sequence are
 CC useful for diagnosing a disorder caused by mutation in HTPL, and in
 CC therapy and manufacture of a medicament for treatment or prevention of

CC such disorder associated with decreased expression or activity of human
 CC HTPL. Such disorders include disorders of testis, or adrenal, adult and
 CC foetal liver, bone marrow, brain, kidney, lung, placenta, prostate,
 CC skeletal muscle or colon function. HTPL, proteins and nucleic acids are
 CC clinically useful diagnostic markers and potential therapeutic agents for
 CC male infertility and cancer. The present oligonucleotide was used in an
 CC example from the invention

 CC
 CC DR Novel polynucleotide which down regulates expression of Ets-related gene,
 CC useful for treating cancer, diabetic retinopathy, macular degeneration,
 CC arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
 CC
 CC PS Claim 4; Page 90; 149pp; English.
 CC
 CC CC The invention relates to a nucleic acid molecule (I) which down regulates
 CC expression of an Ets-related gene (ERG). (I) is useful for treating
 CC conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma,
 CC tumour angiogenesis, diabetic retinopathy, macular degeneration,
 CC neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca
 CC vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge
 CC Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu
 CC syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for
 CC treating a patient having a condition associated with the level of ERG,

CC by contacting cells of the patient with (I) under conditions suitable for
 CC the treatment. The method comprises the use of one or more therapies
 CC under conditions suitable for the treatment. Leukaemia or tumour
 CC angiogenesis is treated by administering (I) to the patient in
 CC conjunction with one or more of other therapies such as radiation or
 CC chemotherapy treatment. (I) is useful for reducing ERG activity in a
 CC cell, by contacting the cell with (I). (I) is useful for cleaving RNA of
 CC ERG gene, by contacting (I) with RNA, in the presence of a divalent
 CC cation such as Mg²⁺. (I) is useful for diagnosis of conditions and
 CC diseases related to the expression of ERG, and as diagnostic tool to
 CC examine genetic drift and mutations within diseased cells or to detect
 CC the presence of ERG RNA in a cell. (I) is useful for specifically
 CC targeting genes that share homology with ERG gene or ERG fusion genes.
 CC ABK17354-ABK22719 represent nucleic acids, including antisense and
 CC enzymatic nucleic acid molecules which regulate expression of ERG, and

DR

XX Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL
 PT -1, useful for treating disorders associated with decreased expression or
 PT activity of human POSHL1.

XX Example 2; SEQ ID NO 716; 60pp + Sequence Listing; English.

XX The invention relates to an isolated SH3 domain (POSH)-like signalling
 CC protein 1 (POSHL1) polypeptide (I), comprising a sequence of 730 amino
 CC acids (S1, AB083999), a sequence having 65% sequence identity to (S1),
 CC (S1) having 95% deviations, especially conservative substitutions or a
 CC fragment of the sequences comprising at least 8 contiguous amino acids.
 CC Human POSHL1 is a proto-oncogene/oncogene product that functions as an
 CC adaptor protein that interacts with Rho family small GTPases as well as
 CC downstream components of the signal transduction pathway. (I) is useful
 CC for identifying a specific binding partner. (I) and nucleic acids (II)
 CC encoding (I) are useful for diagnosing, monitoring disease and treating
 CC caused by altered expression of human POSHL1 including diagnosing and
 CC treating cancer, they useful in the development of vaccines and (II) is
 CC useful in gene therapy. (II) is useful for constructing microarrays which
 CC are useful for measuring and for surveying gene expression and creating
 CC transgenic non-human animals capable of producing the proteins. The
 CC present sequence is that of a scanning oligonucleotide useful in examples
 CC of the invention. Note: The present sequence did not form part of the
 CC printed specification, but is based on sequence information supplied to
 CC Derwent by the European Patent Office

 XX
 CC The present invention relates to nucleic acid molecules which modulate
 CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
 CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
 CC and enzymatic nucleic acids such as hammerhead ribozymes, DNazymes,
 CC inozymes, zincymes, amberzymes, and G-cleaver ribozymes. Also disclosed
 CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse
 CC transcriptase and/or HBV reverse transcriptase primer sequences, as well
 CC as oligonucleotides that specifically bind the Enhancer I region of HBV
 CC DNA. The nucleic acids may be used to modulate the expression of HBV
 CC genes and HBV viral replication. Also disclosed is a method for screening
 CC compounds and/or potential therapies directed against HBV, and compounds
 CC that modulate the expression and/or replication of HCV. The compounds and
 CC methods of the invention are useful for the treatment of degenerative and
 CC disease states related to HBV and HCV infection, replication and gene
 CC expression such as cirrhosis, liver failure, and hepatocellular
 CC carcinoma. The present sequence represents a substrate for one of the HCV
 CC DNazyme or minus strand DNazyme sequences disclosed in the present
 CC invention

 PT useful e.g. for treatment of tumors and viral infection, also related
 PT polypeptide and antibodies.
 XX
 XX Disclosure; Page 369; 771pp; French.
 PS
 XX The invention relates to the isolation of 6327 nucleotide sequences,
 CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
 CC sequence having at least 80% identity, after optimal alignment, with the
 CC nucleotides, a sequence that hybridizes under stringent conditions with
 CC the nucleotides, or the complement, or corresponding RNA, of the

CC nucleotides. The nucleotides are used as probes or primers for detecting,
 CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
 CC sense and antisense sequences, of nucleotides involved in tumour
 CC suppression or reversion, apoptosis and or viral resistance, to produce
 CC recombinant polypeptides, and to prepare transgenic animals, as
 CC experimental models. The nucleotides (also vectors containing them and
 CC cells containing the vectors), the encoded polypeptides and antibodies
 CC (Ab) against the polypeptide are useful for prevention and/or treatment
 CC of viral infections or diseases characterized by development of tumours
 CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
 CC Analysis of the expression of the nucleotides can be used for diagnosis
 CC and/or prognosis of these diseases. The nucleotides and polypeptides can
 CC also be used to screen for their specific interactive molecules,
 CC potentially useful for treating diseases associated with abnormal
 CC expression of the nucleotides.

DR Treating and/or preventing e.g. malaria or tuberculosis, or eliciting an
 PT immune response, comprises administering a priming composition and a
 PT boosting composition containing a non-replicating viral vector in either
 PT order.

XX

PS Claim 8; Page 87; 302pp; English.

XX

CC The invention relates to a fowlpox virus (FPV) genome which has
 CC modifications in one or more wild-type FPV genes. The invention further
 CC relates to a novel method for treating and/or preventing a disease in a
 CC subject comprising administering two compositions, each containing a non-
 CC replicating viral vector. At least one of the compositions comprises a
 CC poxvirus vector derived from a fowlpox virus. The novel compositions have

CC the following activities: virucide, tuberculostatic, protozoacide,
 CC antipyrretic, cytostatic, hepatotropic, and antibacterial. The non-
 CC replicating viral vector is useful in a vaccine for an animal,
 CC particularly a mammal such as a primate, specifically human. The priming
 CC or boosting composition, or the kit is useful for manufacturing a
 CC medicament for treating and/or preventing a disease which is, or results
 CC from, a chronic infection such as malaria, tuberculosis or East Coast
 CC fever, or for eliciting a T-cell immune response in a subject. Non-
 CC cultured CEF cells are useful for growing an avipox virus, such as
 CC fowlpox virus. The method or the vaccine may further be used to treat or
 CC prevent influenza, hepatitis, human papilloma virus and other viral
 CC infections, malignancies such as tumours, leishmaniasis, listeriosis, and
 CC theileria. This polynucleotide sequence represents the deleted region of
 CC the Orf1 gene of the fowlpox virus genome of the invention.

XX

PT Murine and Human interleukin 17D DNA, polypeptides and its fragments,
 PT useful as molecular weight markers.

XX

PS Example 1; Page 56; 72pp; English.

XX

CC This encodes a polyhistidine sequence used in the construction of human
 CC and mouse interleukin-17D immunoglobulin poly histidine-tagged fusion
 CC proteins. The homology between IL-17 and IL-17D suggests that the IL-17D
 CC polypeptide is capable of signalling through cytokine receptors. The IL-
 CC 17D protein and fragments of it are useful as controls for peptide
 CC fragmentation which can be used to determine the isoelectric point of a
 CC sample protein. Antibodies generated against IL-17D and its fragmented
 CC peptides can be used to enhance the accuracy of these molecular weight
 CC markers. IL-17D can also be used as a therapeutic agent for the treatment
 CC of diseases mediated by IL-17D. IL-17D polypeptides bind to B cells. It
 CC is likely that these polypeptides can be used for targeting compounds to
 CC B cells and B cell tumours, and for specific selection of B cell
 CC populations

PT New composition comprising the camptodactyly-arthropathy-coxa vara-
PT pericarditis protein in combination with an anesthetic, useful for
PT treating osteoarthritis, or as lubricants of tissue and joints.
XX
XX Disclosure; Page 29; 34pp; English.
XX

CC The invention relates to a method of treating osteoarthritis via the
CC administration of a composition comprising the camptodactyly-arthropathy-
CC coxa vara-pericarditis (CACP) protein, or portions of the CACP protein.
CC The composition may further comprise a local anesthetic. The composition
CC of the invention may be administered via intra-articular or intravenous
CC injection. The human CACP protein is identified in the invention as being
CC megakaryocyte stimulating factor (MSF). The gene encoding CACP protein
CC (MSF) is located on chromosome 1q25-31, and mutations in this gene are
CC responsible for the heritable disorder camptodactyly- arthropathy-coxa
CC vara-pericarditis, in which patients have synovial hyperplasia without
CC evidence of inflammation. CACP protein (MSF) acts as a synovium
CC lubricant, and can be used to lubricate tissue and joints in the
CC treatment of osteoarthritis. The composition may be applied to reduce the
CC symptoms of osteoarthritis (e.g., joint pain, loss of range of movement
CC or joint damage). Sequences AAF59672-AAF59693 represent PCR primers used
CC to amplify exonic gene fragments from CACP genomic DNA or to amplify cDNA
CC fragments for the detection of mutations

PT New cytochrome P450 subfamily VIIA (cholesterol 7 alphanooxygenase)
PT polypeptide 1 gene variants, useful for studying the expression and
PT activity of CYP7A1 and screening drugs for treating disorders of
PT cholesterol and bile metabolism.
XX
PS Example 1; Page 33; 84pp; English.
XX
CC The invention relates to a novel polymorphic variant of a sequence of
CC CYP7A1 protein or its fragment. The polypeptide has hepatotropic and
CC antilipaeamic activity. The polymorphic variants are useful in studying
CC the expression and function of CYP7A1, in expressing CYP7A1 protein for
CC use in screening candidate drugs to treat diseases related to CYP7A1
CC activity, in studying the effect of the variation on the biological
CC activity of CYP7A1, and the binding affinity of candidate drugs targeting
CC CYP7A1 for the treatment of disorders such as cholesterol and bile
CC disorders. Haplotyping methods are useful in validating CYP7A1 as a
CC candidate target for treating a specific condition or disease predicted
CC to be associated with CYP7A1 activity, or in the design of clinical
CC trials of candidate drugs for treating a specific condition or disease
CC associated with CYP7A1 activity, such as cirrhosis, familial
CC hypertriglyceridaemia and hypercholesterolaemia. Transgenic animals are
CC also useful for studying expression of the CYP7A1 isogenes in vivo, for
CC in vivo screening and testing of drugs targeted against CYP7A1 protein,
CC and for testing the efficacy of therapeutic agents and compounds related
CC to cholesterol and bile acid metabolism. The present sequence represents

CC a PCR primer used in the invention to amplify target regions of the
CC CYP7A1 gene

 XX
 XX Determining ability of test compound to modulate formation of interleukin
 PT soluble trimolecular complex, by bringing into contact the components of
 PT the complex and test compound and determining amount of complex formed.
 XX
 PS Example 2; Page 55; 171pp; English.
 XX
 CC This invention relates to a novel assay for determining the ability of a
 CC test compound to modulate the formation of a trimolecular complex (TC)
 CC including interleukin (IL), a soluble IL-receptor (IL-R) polypeptide and
 CC a soluble IL-R accessory protein (IL-RACP). The method comprises bringing
 CC into contact an IL polypeptide, a soluble IL-R polypeptide, a soluble IL-
 CC RACP polypeptide and a test compound, and determining the amount of TC
 CC formed. The method of the invention is useful for determining the ability
 CC of a test compound to modulate the formation of a trimolecular complex
 CC including IL, a soluble IL-R and a soluble IL-RACP. The method is useful
 CC for high throughput screening and enables direct measurement of protein
 CC binding characteristics. It is also useful for identifying small molecule
 CC inhibitors of TC and hence of IL-1 biological activity. The method may be
 CC used in screening methods and assays for agents which modulate the
 CC interaction between IL and IL-R, and/or the interaction between IL-RACP
 CC and the IL-R/IL biomolecular complexes. This method identifies small
 CC molecule inhibitors of TC and hence IL-1 biological activity, and
 CC provides a significant advantage over prior methods since it is possible
 CC to dose orally and to reduce the cost of production of such compounds
 CC compared to the production cost of recombinant proteins. The main
 CC advantage of using soluble forms of the proteins in the method is the
 CC ease with which these reagents enable the formatting and running of High
 CC Throughput Screening (HTS) assays. The present sequence represents a DNA
 CC sequence encoding an interleukin 1 family protein used in the method of
 CC the invention

CC T30458) were isolated using primers specific for the 5' untranslated
CC region of the variable region, and for the intron downstream of the
CC rearranged J region (see AAT30459-T30545). The amplified sequences can be
CC inserted into vectors containing heterologous (such as human) constant
CC region genes, for the production of chimeric and isotype-switched
CC antibodies. The antibodies are useful in the treatment and diagnosis of
CC infection by RSV, such as pneumonia and bronchiolitis, in humans and
CC animals. By using genomic DNA as a template, variable region genes can be
CC isolated without producing fragments that have to be adapted for
CC recombinant antibody expression. Also, by using the genomic DNA, no
CC knowledge of the DNA sequence encoding the target variable region is
CC required. Chimeric antibodies produced from the encoded proteins, that
CC contain the constant region of the host being treated, are less likely to
CC cause adverse immune reactions

XX
XX Use of a prostate cancer associated gene and biallelic markers derived
PT from it.
XX
XX Claim 4; Page 370; 385pp; English.
XX
XX The invention relates to a mammalian PGI gene and protein, and a set of
CC PGI biallelic markers. The PGI polynucleotide and biallelic markers are
CC used in a hybridisation assay, a sequencing assay, or in an allele-
CC specific amplification assay for determining the identity of a nucleotide
CC at a PGI-related biallelic marker. The methods can be used to detect and
CC to assess the risk of developing cancer or prostate cancer. Early-stage
CC diagnosis of prostate cancer relies on prostate specific antigen (PSA)
CC dosage. However, the effectiveness of this is limited due to its
CC inability to discriminate between malignant and non-malignant affections
CC of the organ. A need exists for both a reliable diagnostic procedure
CC which would enable early-stage diagnosis, and for preventative and
CC curative treatments of the disease. The PGI gene can be used for
CC detection of prostate cancer, and the risk of developing it in the
CC future, and can also be used to determine therapies for the disease

XX
XX The specification describes a method for detecting mycobacteria,
CC especially for differentiating, in diagnostic terms, an immunisation
CC resulting from BCG vaccination or an infection by M. tuberculosis. The
CC method comprises detection of polynucleotide sequences that are deleted
CC from the genome of Mycobacterium bovis but present in the genome of M.
CC tuberculosis, or vice versa. The polynucleotide sequences that are
CC deleted are the following genes or open reading frames (ORFs): RV2346C,
CC RV2347C, RV2348C, pLcC, pLcB, pLcA, RV2352C, RV2353C, RV3425, RV3426,

PS Example 13; Col 44; 69pp; English.
XX
XX The present invention describes compounds of 8-30 nucleobases antisense
CC to a nucleic acid encoding human or mouse tumour necrosis factor receptor
CC 2 (TNFR2). Also described is a method for inhibiting expression of human
CC or mouse TNFR2 comprising contacting cells or tissues in vitro with one
CC of the claimed compounds. The antisense compounds are used to treat a
CC disease or condition associated with expression of TNFR2. The present
CC sequence represents a PCR probe for human TNFR2, which is used in an
CC example from the present invention

XX
XX A novel nucleic acid corresponding to ATP-binding cassette transporter
PT genes and the encoded polypeptide, useful for preventing or treating a
PT dysfunction in reverse transport of cholesterol.
XX
XX Claim 9; Page 106; 216pp; English.
XX
XX The present invention describes human ATP-binding cassette transporters
CC (ABC). Specifically described are the human ABCA5, ABCA6, ABCA9 and
CC ABCA10 genes (see ABN89594 to ABN89597) which encode the proteins given
CC in ABN81574 to ABN81577). ABN89598 to ABN89715 represent ABCA5, ABCA6,
CC ABCA9 and ABCA10 nucleotide fragments; and ABN89716 to ABN89806 represent
CC primers for ABCA5, ABCA6, ABCA9 and ABCA10 genes which are used in the
CC exemplification of the present invention. The ABC sequences have
CC antiarteriosclerotic activities and can be used in gene therapy. ABC
CC prevention and/or treatment of a subject affected by a dysfunction in the
CC reverse transport of cholesterol. The ABC proteins are involved in the
CC reverse transport of cholesterol, in membrane transport of lipophilic
CC molecules, in particular inflammation mediating substance such as
CC prostaglandins and prostacyclins, or in any pathology whose candidate
CC chromosomal region is situated on chromosome 17. They are also useful for
CC the manufacture of a medicament intended for prevention of
CC arteriosclerosis in various forms. The ABCA5, ABCA6, ABCA9 and ABCA10
XX genes are located to chromosome 17, more specifically to the 17q24 locus

PT Detection and/or genetic analysis of hepatitis B virus - specifically
 PT genotype, preCore mutations, vaccine escape mutations and RT gene
 PT mutations selected by treatment with drugs.

XX Disclosure; Page 31; 80pp; English.

XX This sequence represents a probe for hepatitis b virus (HBV), used in the
 CC method of the invention for detection and/or genetic analysis of
 CC hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally
 CC releasing, isolating or concentrating polynucleic acids (I) in the
 CC sample, and amplifying the relevant part of a suitable HBV gene in the
 CC sample with at least 1 suitable primer pair; (b) hybridising (I) with a
 CC combination of at least 2 nucleotide probes, which are applied to known
 CC locations on a solid support and hybridise specifically to mutant target
 CC sequences chosen from the HBV RT pol gene region, HBV preCore region,
 CC HBsAg region and/or HBV genotype specific target sequences, or their
 CC complements or U for T homologues; (c) detecting the hybrids formed in
 CC step (b), and inferring the HBV genotype and/or mutants present in the
 CC sample from the differential hybridisation signal(s). The composition can
 CC be used to diagnose and/or monitor HBV mutants and/or genotypes in a
 CC sample, specifically genotype, preCore mutations, vaccine escape

CC mutations and RT gene mutations selected by treatment with drugs, e.g.
 CC lamivudine and penciclovir. (Updated on 27-AUG-2003 to correct OS field.)

 PT Increasing storage lipid content in seeds and plants - by inhibiting
 PT cytosolic pyruvate kinase.
 XX
 PS Disclosure; Page 7; 28pp; English.
 XX
 CC This primer was used to amplify Brassica napus DNA encoding a
 CC phosphoenolpyruvate carboxylase. The storage lipid content of a seed is
 CC increased by reducing the activity of endogenous cytosolic pyruvate
 CC kinase in the seed. This is applied to plants which accumulate storage
 CC protein and lipid in the embryo, particularly an oilseed plant such as
 CC soya, sunflower, sesame or especially rapeseed. Inhibitory enzymes
 CC involved in amino acid biosynthesis increases production of lipid by
 CC directing more of the precursor to the chloroplast

 PT Detection of chromosomal abnormalities - by subjecting patient sample
 PT nucleic acids to a multiplex molecular amplification procedure using
 PT primers specific for characteristic nucleic acid sequence.
 XX
 PS Claim 73; Page 79; 126pp; English.
 XX

XX This sequence represents a primer used in the method of the invention for
 CC the detection of the presence or absence of chromosomal abnormalities,
 CC each abnormality being associated with a condition in a subject and each
 CC being defined by at least one characteristic nucleic acid sequence. The
 CC method comprises: (a) obtaining a sample of nucleic acids derived from a

CC subject which may harbour one of the chromosomal abnormalities; (b)
 CC subjecting the sample to a multiplex molecular amplification (MMA)
 CC procedure, where a number of the characteristic sequences, if present in
 CC a sufficient amount, will be amplified; (c) retrieving the product(s)
 CC from step (b), and detecting the presence and/or absence of an amplicon
 CC characteristic of the abnormal sequences to detect the presence or
 CC absence of corresponding chromosomal abnormalities; where the MMA
 CC procedure comprises the use of at least 7 mutually distinct primers (MDP)
 CC in one single reaction mixture, each of the primers defining an end of at
 CC least one characteristic nucleic acid sequence, and where at least one of
 CC the primers defines the first end of at least two characteristic nucleic
 CC acid sequences, the characteristic nucleic acid sequences each being
 CC determined in their opposite ends by MDP selected from the remainder of
 CC the MDP. The methods can be used for detecting chromosomal abnormalities
 CC associated with diseases including numerous leukaemia's, lymphoma's,
 CC carcinoma's, adenocarcinoma's, sarcoma's, glioma's, neuroblastoma's,
 CC medullablastoma, malignant melanoma, and malignant neoplastic conditions

 PT Human hRAD54 DNA and polypeptide - and agonists, antibodies, antagonists,
 PT etc.
 XX
 PS Example; Page 23; 64pp; English.
 XX

XX The present sequence represents a PCR primer used in the example from the
 CC present invention. The method of the invention is for determining the
 CC genetic predisposition to cancer in an individual by detecting hRAD54
 CC mutations in a sample. hRAD54 is a gene thought to be present in tumours
 CC that display allelic imbalance at 1p32, the chromosomal band identified
 CC as one of four minimal regions of chromosome 1 deletion in breast

CC carcinomas. hRAD54 is useful for production of proteins, inter alia, that
 CC have been identified as novel hRAD54 by homology between the amino acid
 CC sequence given in AAW62186 and known amino acid sequences such as yeast
 CC RAD54. hRAD54 proteins are used in the treatment of cancer, including
 CC xeroderma pigmentosum and Bloom syndrome, Werner's syndrome and X-linked
 CC mental retardation with alpha-thalassemia syndrome and breast cancer.
 CC hRAD54 polynucleotides are also useful for detecting complementary
 CC nucleotides for use as a diagnostic agent, especially useful for
 CC diagnosis of disease or susceptibility to diseases. hRAD54
 CC polynucleotide, proteins, agonists and antagonists which are proteins are
 CC useful in gene therapy

 PT New mouse prostatic acid phosphatase - used to induce an immune response
 PT against tumour related antigens.
 XX
 PS Example 1; Page 12; 30pp; English.
 XX

This is the nucleotide sequence of primer AAA31093, which was used with
 CC primer AAA31091 (see AAV45599) for the PCR amplification of novel mouse
 CC prostatic acid phosphatase (PAP) cDNA from mouse prostate. The primers
 CC are based on partial mouse PAP clones obtained by 5' and 3'RACE (see
 CC AAV45593-98). The isolated full-length cDNA includes a 1158 bp coding
 CC region (see AAV45592) encoding a 385-amino acid polypeptide (see
 CC AAW30574). PAP cDNA can be used in the recombinant production of mouse
 CC PAP. A method for producing an immune response against an autologous
 CC polypeptide tumour antigen (e.g. human PAP) involves immunising a subject
 CC with a xenogeneic antigen (e.g. mouse PAP)

 PT Detection of BRCA1 and BRCA2 gene mutations in a single hybridization
 PT step.
 XX
 PS Claim 10; Page 16; 44pp; English.
 XX

The invention relates to the use of allele-specific oligonucleotides
 CC AAX34376-X34391 as probes for the detection of mutant BRCA1 and BRCA2
 CC genes. The probes are immobilised on a membrane and labelled target
 CC nucleotide sequences, which hybridise to the probes, are detected after a
 CC single hybridization step. The method and allele-specific
 CC oligonucleotides are used to detect gene mutations that predispose
 CC individuals to breast and ovarian cancer

XX WPI; 2001-300427/31.
XX
XX Treating proliferative skin or eye diseases and scarring, using ribozymes
PT that cleave RNA encoding cytokines involved in inflammation, matrix
PT metalloproteinases, growth factors and cell-cycle dependent kinases.
XX
XX Example 1; Page 100; 408pp; English.
XX
XX The present invention describes a method for treating a proliferative
CC skin or eye disease and scarring. The method involves administering a
CC ribozyme (I) which cleaves RNA encoding a cytokine involved in
CC inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
CC dependent kinase, growth factor or a reductase, or administering a
CC nucleic acid molecule (II) comprising a promoter operably linked to a
CC nucleic acid segment encoding (I). (I) can have antipsoriatic,
CC dermatological, cytostatic, antiseborrheic, antidiabetic, antickling,
CC ophthalmological, vulnery, keratolytic and virucide activities, and
CC cleaves RNA encoding cytokine involved in inflammation. (I) can be used
CC in gene therapy. (I) and (II) are useful for treating proliferative skin
CC diseases such as psoriasis, atopic dermatitis, actinic keratosis,
CC squamous or basal cell carcinoma and viral or seborrheic wart. They can
CC also be used for treating proliferative eye diseases such as diabetic
CC retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
CC prematurity and retinal detachment, and for treating and preventing
CC scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
CC scar. AAH57577 to AAH62099 represent sequences used in the
CC exemplification of the present invention

 XX
 XX The present invention describes a method for treating a proliferative
 CC skin or eye disease and scarring. The method involves administering a
 CC ribozyme (I) which cleaves RNA encoding a cytokine involved in
 CC inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
 CC dependent kinase, growth factor or a reductase, or administering a
 CC nucleic acid molecule (II) comprising a promoter operably linked to a
 CC nucleic acid segment encoding (I). (I) can have antiproliferative,
 CC dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,
 CC ophthalmological, vulvular, keratolytic and virucide activities, and
 CC cleaves RNA encoding cytokine involved in inflammation. (I) can be used
 CC in gene therapy. (I) and (II) are useful for treating proliferative skin
 CC diseases such as psoriasis, atopic dermatitis, actinic keratosis,
 CC squamous or basal cell carcinoma and viral or seborrheic wart. They can
 CC also be used for treating proliferative eye diseases such as diabetic
 CC retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
 CC prematurity and retinal detachment, and for treating and preventing
